The data types of the other operand and result are implied by the <dt> field combined with the instruction shape. For information about data type formats see [Data types supported by the Advanced SIMD implementation on page E1-2293](#).

In the instruction syntax descriptions in [Chapter F2 About the T32 and A32 Instruction Descriptions](#), the <dt> field is usually specified as a single field. However, where more convenient, it is sometimes specified as a concatenation of two fields, <type><size>.

Syntax flexibility

There is some flexibility in the data type specifier syntax:

- Software can specify three data types, specifying the result and both operand data types. For example:
 VSUBW.I16.I16.S8 Q3, Q5, D0 instead of VSUBW.S8 Q3, Q5, D0
- Software can specify two data types, specifying the data types of the two operands. The data type of the result is implied by the instruction shape. For example:
 VSUBW.I16.S8 Q3, Q5, D0 instead of VSUBW.S8 Q3, Q5, D0
- Software can specify two data types, specifying the data types of the single operand and the result. For example:
 VMOVN.I16.I32 D0, Q1 instead of VMOVN.I32 D0, Q1
- Where an instruction requires a less specific data type, software can instead specify a more specific type, as shown in [Table F2-9](#).
- Where an instruction does not require a data type, software can provide one.
- The F32 data type can be abbreviated to F.
- The F64 data type can be abbreviated to D.

In all cases, if software provides additional information, the additional information must match the instruction shape. Disassembly does not regenerate this additional information.

Table F2-9 Data type specification flexibility

Specified data type	Permitted more specific data types				
None	Any				
.I<size>	-	.S<size>	.U<size>	-	-
.8	.I8	.S8	.U8	.P8	-
.16	.I16	.S16	.U16	.P16	.F16
.32	.I32	.S32	.U32	-	.F32 or .F
.64	.I64	.S64	.U64	-	.F64 or .D

F2.9.6 Register specifiers

The <dest>, <src1>, and <src2> fields contain register specifiers, or in some cases scalar specifiers or register lists. Table F2-10 shows the register and scalar specifier formats that appear in the instruction descriptions.

If <dest> is omitted, it is the same as <src1>.

Table F2-10 Advanced SIMD and floating-point register specifier formats

<specifier>	Usual meaning ^a	Used in
<Qd>	A quadword destination register for the result vector.	Advanced SIMD
<Qn>	A quadword source register for the first operand vector.	Advanced SIMD
<Qm>	A quadword source register for the second operand vector.	Advanced SIMD
<Dd>	A doubleword destination register for the result vector.	Both
<Dn>	A doubleword source register for the first operand vector.	Both
<Dm>	A doubleword source register for the second operand vector.	Both
<Sd>	A singleword destination register for the result vector.	Floating-point
<Sn>	A singleword source register for the first operand vector.	Floating-point
<Sm>	A singleword source register for the second operand vector.	Floating-point
<Dd[x]>	A destination scalar for the result. Element x of vector <Dd>.	Advanced SIMD
<Dn[x]>	A source scalar for the first operand. Element x of vector <Dn>.	Both ^b
<Dm[x]>	A source scalar for the second operand. Element x of vector <Dm>.	Advanced SIMD
<Rt>	A general-purpose register, used for a source or destination address.	Both
<Rt2>	A general-purpose register, used for a source or destination address.	Both
<Rn>	A general-purpose register, used as a load or store base address.	Both
<Rm>	A general-purpose register, used as a post-indexed address source.	Both

a. In some instructions the roles of registers are different.

b. In the floating-point instructions, <Dn[x]> is used only in *VMOV* (scalar to general-purpose register), see *VMOV* (scalar to general-purpose register) on page F6-3502.

F2.9.7 Register lists

A register list is a list of register specifiers separated by commas and enclosed in brackets { and }. There are restrictions on what registers can appear in a register list. These restrictions are described in the individual instruction descriptions. Table F2-11 shows some register list formats, with examples of actual register lists corresponding to those formats.

———— **Note** —————

Register lists must not wrap around the end of the register bank.

Syntax flexibility

There is some flexibility in the register list syntax:

- Where a register list contains consecutive registers, they can be specified as a range, instead of listing every register, for example {D0-D3} instead of {D0, D1, D2, D3}.
- Where a register list contains an even number of consecutive doubleword registers starting with an even numbered register, it can be written as a list of quadword registers instead, for example {Q1, Q2} instead of {D2-D5}.
- Where a register list contains only one register, the enclosing braces can be omitted, for example VLD1.8 D0, [R0] instead of VLD1.8 {D0}, [R0].

Table F2-11 Example register lists

Format	Example	Alternative
{<Dd>}	{D3}	D3
{<Dd>, <Dd+1>, <Dd+2>}	{D3, D4, D5}	{D3-D5}
{<Dd[x]>, <Dd+2[x]>}	{D0[3], D2[3]}	-
{<Dd[]>}	{D7[]}	D7[]

F2.9.8 Register encoding

An Advanced SIMD register is either:

- *Quadword*, meaning it is 128 bits wide.
- *Doubleword*, meaning it is 64 bits wide.

Some instructions have options for either doubleword or quadword registers. This is normally encoded in Q, bit[6], as Q = 0 for doubleword operations, or Q = 1 for quadword operations.

A floating-point register is either:

- *Double-precision*, meaning it is 64 bits wide.
- *Single-precision*, meaning it is 32 bits wide.

This is encoded in the sz field, bit[8], as sz = 1 for double-precision operations, or sz = 0 for single-precision operations.

The T32 instruction encoding of Advanced SIMD or floating-point registers is:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
								D	Vn				Vd				sz	N	Q	M	Vm										

The A32 instruction encoding of Advanced SIMD or floating-point registers is:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
								D	Vn				Vd				sz	N	Q	M	Vm										

Some instructions use only one or two registers, and use the unused register fields as additional opcode bits.

Table F2-12 shows the encodings for the registers.

Table F2-12 Encoding of register numbers

Register mnemonic	Usual usage	Register number encoded in ^a	Notes ^a	Used in
<Qd>	Destination (quadword)	D, Vd (bits[22, 15:13])	bit[12] == 0 ^b	Advanced SIMD
<Qn>	First operand (quadword)	N, Vn (bits[7, 19:17])	bit[16] == 0 ^b	Advanced SIMD
<Qm>	Second operand (quadword)	M, Vm (bits[5, 3:1])	bit[0] == 0 ^b	Advanced SIMD
<Dd>	Destination (doubleword)	D, Vd (bits[22, 15:12])	-	Both
<Dn>	First operand (doubleword)	N, Vn (bits[7, 19:16])	-	Both
<Dm>	Second operand (doubleword)	M, Vm (bits[5, 3:0])	-	Both
<Sd>	Destination (single-precision)	Vd, D (bits[15:12, 22])	-	Floating-point
<Sn>	First operand (single-precision)	Vn, N (bits[19:16, 7])	-	Floating-point
<Sm>	Second operand (single-precision)	Vm, M (bits[3:0, 5])	-	Floating-point

- a. Bit numbers given for the A32 instruction encoding. See the figures in this section for the equivalent bits in the T32 encoding.
 b. If this bit is 1, the instruction is UNDEFINED.

F2.9.9 Advanced SIMD scalars

Advanced SIMD scalars can be 8-bit, 16-bit, 32-bit, or 64-bit. Instructions other than multiply instructions can access any element in the register set. The instruction syntax refers to the scalars using an index into a doubleword vector. The descriptions of the individual instructions contain details of the encodings.

Table F2-13 shows the form of encoding for scalars used in multiply instructions. These instructions cannot access scalars in some registers. The descriptions of the individual instructions contain cross references to this section where appropriate.

32-bit Advanced SIMD scalars, when used as single-precision floating-point numbers, are equivalent to Floating-point single-precision registers. That is, $Dm[x]$ in a 32-bit context ($0 \leq m \leq 15$, $0 \leq x \leq 1$) is equivalent to $S[2m + x]$.

Table F2-13 Encoding of scalars in multiply instructions

Scalar mnemonic	Usual usage	Scalar size	Register specifier	Index specifier	Accessible registers
<Dm[x]>	Second operand	16-bit	Vm[2:0]	M, Vm[3]	D0-D7
		32-bit	Vm[3:0]	M	D0-D15

Chapter F3

The T32 Instruction Set Encoding

This chapter introduces the T32 instruction set and describes how it uses the ARM programmers' model. It contains the following sections:

- [Top level T32 instruction set encoding on page F3-2424.](#)
- [16-bit T32 instruction encoding on page F3-2426.](#)
- [32-bit T32 instruction encoding on page F3-2437.](#)

In this chapter:

- In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
- In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.

F3.1 Top level T32 instruction set encoding

The T32 instruction stream is treated as a sequence of halfword-aligned halfwords. Each T32 instruction is either a single 16-bit halfword in that stream, or a 32-bit instruction consisting of two consecutive halfwords in that stream.

When the value of bits[15:11] of the halfword being decoded is one of the following, the halfword is the first halfword of a 32-bit instruction:

- 0b11101.
- 0b11110.
- 0b11111.

Otherwise, the halfword is a 16-bit instruction.

Table F3-1 Main encoding table for the T32 instruction set

Decode fields		Decode group or instruction page
op0	op1	
!= 111	-	16-bit T32 instruction encoding on page F3-2426
111	00	B - T2 variant
111	!= 00	32-bit T32 instruction encoding on page F3-2437

The behavior of an attempt to execute an unallocated instruction is described in [UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space on page F2-2403](#).

F3.1.1 About the T32 Advanced SIMD and floating-point instructions and their encoding

The Advanced SIMD and floating-point instructions are common to the T32 and A32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

- In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
- There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

All T32 Advanced SIMD and floating-point instructions have 32-bit encodings. Different groups of these instructions are decoded from different points in the 32-bit T32 instruction decode structure. [Table F3-2](#) shows these instruction groups, and where each group is decoded from the overall T32 decode structure:

Table F3-2 Advanced SIMD and floating-point instructions in the T32 decode structure

Advanced SIMD and floating-point instruction group	T32 decode is from
Advanced SIMD data-processing on page F3-2444	System register access, Advanced SIMD, and floating-point instructions on page F3-2437
Floating-point data-processing on page F3-2440	System register access, Advanced SIMD, and floating-point instructions on page F3-2437

Table F3-2 Advanced SIMD and floating-point instructions in the T32 decode structure (continued)

Advanced SIMD and floating-point instruction group	T32 decode is from
<i>Floating-point and Advanced SIMD 32-bit register moves on page F3-2443</i>	<i>System register access, Advanced SIMD, and floating-point instructions on page F3-2437</i>
<i>Advanced SIMD and floating-point Load/Store and 64-bit register moves on page F3-2438</i>	<i>System register access, Advanced SIMD, and floating-point instructions on page F3-2437</i>
<i>Advanced SIMD element or structure Load/Store on page F3-2469</i>	<i>32-bit T32 instruction encoding on page F3-2437</i>

F3.2 16-bit T32 instruction encoding

This section describes the encoding of the 16-bit T32 instruction encoding group. This section is decoded from *Top level T32 instruction set encoding* on page F3-2424.

Decode fields		Decode group or instruction page

Chapter F4

The A32 Instruction Set Encoding

This chapter describes the encoding of the A32 instruction set. It contains the following sections:

- *Top level A32 instruction set encoding* on page F4-2490.
- *Data-processing and miscellaneous instructions* on page F4-2492.
- *Load/Store Word, Unsigned byte (immediate, literal)* on page F4-2509.
- *Load/Store Word, Unsigned byte (register)* on page F4-2510.
- *Media instructions* on page F4-2511.
- *Branch, branch with link, and block data transfer* on page F4-2519.
- *System register access, Advanced SIMD, floating-point, and Supervisor Call* on page F4-2521.
- *Unconditional instructions* on page F4-2530.

In this chapter:

- In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
- In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.

F4.1 Top level A32 instruction set encoding

The A32 instruction stream is a sequence of word-aligned words. Each A32 instruction is a single 32-bit word in that stream. The encoding of an A32 instruction is:

Most A32 instructions can be conditional, with a condition determined by bits[31:28] of the instruction, the cond field. For more information, see [The condition code field in A32 instruction encodings on page F2-2398](#). This applies to all instructions except those with the cond field equal to 0b1111.

[Table F4-1](#) shows the top-level encoding of the A32 instruction set, including the cases where bits[31:28] are defined as 0b1111 rather than as the cond.

The behavior of an attempt to execute an unallocated instruction is described in [UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space on page F2-2403](#).

For more information on A32 instruction encodings see [Chapter F2 About the T32 and A32 Instruction Descriptions](#).

Table F4-1 Main encoding table for the A32 instruction set

-	11x	-	System register access, Advanced SIMD, floating-point, and Supervisor Call on page F4-2521
1111	0xx	-	Unconditional instructions on page F4-2530

F4.1.1 About the A32 Advanced SIMD and floating-point instructions and their encodings

The Advanced SIMD and floating-point instructions are common to the A32 and T32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

- In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
- There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

Different groups of the A32 Advanced SIMD and floating-point instructions are decoded from different points in the A32 instruction decode structure. [Table F4-2 on page F4-2491](#) shows these instruction groups, and where each group is decoded from the overall A32 decode structure:

Table F4-2 Advanced SIMD and floating-point instructions in the A32 decode structure

Advanced SIMD and floating-point instruction group	A32 decode is from
<i>Advanced SIMD data-processing on page F4-2531</i>	<i>Unconditional instructions on page F4-2530</i>
<i>Floating-point data-processing on page F4-2523</i>	<i>System register access, Advanced SIMD, floating-point, and Supervisor Call on page F4-2521</i>
<i>Floating-point and Advanced SIMD 32-bit register moves on page F4-2526</i>	<i>System register access, Advanced SIMD, floating-point, and Supervisor Call on page F4-2521</i>
<i>Floating-point and Advanced SIMD Load/Store and 64-bit register moves on page F4-2521</i>	<i>System register access, Advanced SIMD, floating-point, and Supervisor Call on page F4-2521</i>
<i>Advanced SIMD element or structure Load/Store on page F4-2543</i>	<i>Unconditional instructions on page F4-2530</i>

F4.2 Data-processing and miscellaneous instructions

This section describes the encoding of the Data-processing and miscellaneous instructions group. This section is decoded from *Top level A32 instruction set encoding* on page F4-2490.

Chapter F5

T32 and A32 Base Instruction Set Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Alphabetical list of T32 and A32 base instruction set instructions on page F5-2550.*
- *Encoding and use of Banked register transfer instructions on page F5-3214.*

F5.1 Alphabetical list of T32 and A32 base instruction set instructions

This section lists every instruction in the T32 and A32 base instruction sets. For details of the format used see [Format of instruction descriptions on page F2-2392](#).

This section is formatted so that each instruction description starts on a new page.

F5.1.1 ADC, ADCS (immediate)

Add with Carry (immediate) adds an immediate value and the Carry flag value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

ADC variant

Applies when `S == 0`.

`ADC{<c>}{<q>} {<Rd>}, {<Rn>, #<const>`

ADCS variant

Applies when `S == 1`.

`ADCS{<c>}{<q>} {<Rd>}, {<Rn>, #<const>`

Decode for all variants of this encoding

`d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);`

T1

ADC variant

Applies when `S == 0`.

`ADC{<c>}{<q>} {<Rd>}, {<Rn>, #<const>`

ADCS variant

Applies when `S == 1`.

ADCS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);  
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.

For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    (result, nzcV) = AddWithCarry(R[n], imm32, PSTATE.C);  
    if d == 15 then // Can only occur for A32 encoding  
        if setflags then  
            ALUExceptionReturn(result);  
        else  
            ALUWritePC(result);  
    else  
        R[d] = result;  
        if setflags then  
            PSTATE.<N,Z,C,V> = nzcV;
```

F5.1.2 ADC, ADCS (register)

Add with Carry (register) adds a register value, the Carry flag value, and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

ADC, rotate right with extend variant

Applies when `S == 0` && `imm5 == 00000` && `type == 11`.

`ADC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

ADC, shift or rotate by value variant

Applies when `S == 0` && `!(imm5 == 00000 && type == 11)`.

`ADC{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

ADCS, rotate right with extend variant

Applies when `S == 1` && `imm5 == 00000` && `type == 11`.

`ADCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

ADCS, shift or rotate by value variant

Applies when `S == 1` && `!(imm5 == 00000 && type == 11)`.

`ADCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	0	1	0	1	Rm	Rdn		

T1 variant

ADC<c>{<q>} {<Rdn>}, <Rdn>, <Rm> // Inside IT block
 ADCS{<q>} {<Rdn>}, <Rdn>, <Rm> // Outside IT block

Decode for this encoding

```
d = UInt(Rdn); n = UInt(Rdn); m = UInt(Rm); setFlags = !InITBlock();
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	0	1	0	S	Rn	(0)	imm3	Rd	imm2	type	Rm						

ADC, rotate right with extend variant

Applies when S == 0 && imm3 == 000 && imm2 == 00 && type == 11.

ADC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

ADC, shift or rotate by value variant

Applies when S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11).

ADC<c>.W {<Rd>}, <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 ADC{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

ADCS, rotate right with extend variant

Applies when S == 1 && imm3 == 000 && imm2 == 00 && type == 11.

ADCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

ADCS, shift or rotate by value variant

Applies when S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11).

ADCS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 ADCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setFlags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .								
<q>	See Standard assembler syntax fields on page F2-2396 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285. For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. <p>For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.</p>								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when type = 00</td> </tr> <tr> <td>LSR</td> <td>when type = 01</td> </tr> <tr> <td>ASR</td> <td>when type = 10</td> </tr> <tr> <td>ROR</td> <td>when type = 11</td> </tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.								

In T32 assembly:

- Outside an IT block, if ADCS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ADCS <Rd>, <Rn> had been written.
- Inside an IT block, if ADC<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ADC<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, PSTATE.C);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else

```

```
        ALUwritePC(result);  
else  
    R[d] = result;  
    if setflags then  
        PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.3 ADC, ADCS (register-shifted register)

Add with Carry (register-shifted register) adds a register value, the Carry flag value, and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0 0 0 0				1 0 1		S	Rn	Rd	Rs	0	type	1	Rm					
cond																						

Flag setting variant

Applies when S == 1.

ADCS{<c>}{<q>} {<Rd>,<Rn>, <Rm>, <type> <Rs>

Not flag setting variant

Applies when S == 0.

ADC{<c>}{<q>} {<Rd>,<Rn>, <Rm>, <type> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: LSL when type = 00 LSR when type = 01 ASR when type = 10 ROR when type = 11
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], shifted, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzc;
```

F5.1.4 ADD, ADDS (immediate)

Add (immediate) adds an immediate value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rdn> Is the general-purpose source and destination register, encoded in the "Rdn" field.

<imm8> Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction.

For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see [ADD, ADDS \(SP plus immediate\)](#). If the PC is used, see [ADR](#).

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see [ADD, ADDS \(SP plus immediate\)](#).

<imm3> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.

For encoding T3: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

When multiple encodings of the same length are available for an instruction, encoding T3 is preferred to encoding T4 (if encoding T4 is required, use the `ADDW` syntax). Encoding T1 is preferred to encoding T2 if <Rd> is specified and encoding T2 is preferred to encoding T1 if <Rd> is omitted.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], imm32, '0');
    if d == 15 then // Can only occur for A32 encoding
      if setflags then
```

```
        ALUExceptionReturn(result);
    else
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        (result, nzcvc) = AddWithCarry(R[n], imm32, '0');
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.5 ADD, ADDS (register)

Add (register) adds a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285*.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state on page G1-3819*.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rdn> Is the general-purpose source and destination register, encoded in the "DN:Rdn" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#). The assembler language allows <Rdn> to be specified once or twice in the assembler syntax. When used inside an IT block, and <Rdn> and <Rm> are in the range R0 to R7, <Rdn> must be specified once so that encoding T2 is preferred to encoding T1. In all other cases there is no difference in behavior when <Rdn> is specified once or twice.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. When used inside an IT block, <Rd> must be specified. When used outside an IT block, <Rd> is optional, and:

- If omitted, this register is the same as <Rn>.
- If present, encoding T1 is preferred to encoding T2.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used. If the SP is used, see [ADD, ADDS \(SP plus register\)](#).

- For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.
- For encoding T3: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see [ADD, ADDS \(SP plus register\)](#).
- <Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
- For encoding T1 and T3: is the second general-purpose source register, encoded in the "Rm" field.
- For encoding T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
- | | |
|-----|----------------|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |
- <amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
- For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Inside an IT block, if ADD<c> <Rd>, <Rn>, <Rd> cannot be assembled using encoding T1, it is assembled using encoding T2 as though ADD<c> <Rd>, <Rn> had been written. To prevent this happening, use the .W qualifier.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzc;
```

F5.1.6 ADD, ADDS (register-shifted register)

Add (register-shifted register) adds a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!=1111				0	0	0	0	1	0	0	S	Rn	Rd	Rs	0	type	1	Rm			
cond																					

Flag setting variant

Applies when S == 1.

ADDS{<c>}{<q>} {<Rd>}, {<Rn>, <Rm>, <type> <Rs>

Not flag setting variant

Applies when S == 0.

ADD{<c>}{<q>} {<Rd>}, {<Rn>, <Rm>, <type> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .								
<q>	See Standard assembler syntax fields on page F2-2396 .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when type = 00</td> </tr> <tr> <td>LSR</td> <td>when type = 01</td> </tr> <tr> <td>ASR</td> <td>when type = 10</td> </tr> <tr> <td>ROR</td> <td>when type = 11</td> </tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], shifted, '0');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzc;
```

F5.1.7 ADD, ADDS (SP plus immediate)

Add to SP (immediate) adds an immediate value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

ADD variant

Applies when `S == 0`.

ADD{<c>}{<q>} {<Rd>}, SP, #<const>

ADDS variant

Applies when `S == 1`.

ADDS{<c>}{<q>} {<Rd>}, SP, #<const>

Decode for all variants of this encoding

`d = UInt(Rd); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);`

T1

T1 variant

ADD{<c>}{<q>} <Rd>, SP, #<imm8>

Decode for this encoding

`d = UInt(Rd); setflags = FALSE; imm32 = ZeroExtend(imm8:'00', 32);`

T2

15	14	13	12	11	10	9	8	7	6								0
1	0	1	1	0	0	0	0	0		imm7							

T2 variant

ADD{<c>}{<q>} {SP,} SP, #<imm7>

Decode for this encoding

d = 13; setflags = FALSE; imm32 = ZeroExtend(imm7:'00', 32);

T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7								0
1	1	1	1	0	i	0	1	0	0	0	S	1	1	0	1	0	imm3		Rd			imm8							

ADD variant

Applies when S == 0.

ADD{<c>}.W {<Rd>}, SP, #<const> // <Rd>, <const> can be represented in T1 or T2
 ADD{<c>}{<q>} {<Rd>}, SP, #<const>

ADDS variant

Applies when S == 1 && Rd != 1111.

ADDS{<c>}{<q>} {<Rd>}, SP, #<const>

Decode for all variants of this encoding

if Rd == '1111' && S == '1' then SEE CMN (immediate);
 d = UInt(Rd); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);
 if d == 15 && !setflags then UNPREDICTABLE;

T4

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7								0
1	1	1	1	0	i	1	0	0	0	0	0	0	1	1	0	1	0	imm3		Rd			imm8						

T4 variant

ADD{<c>}{<q>} {<Rd>}, SP, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
 ADDW{<c>}{<q>} {<Rd>}, SP, #<imm12> // <imm12> can be represented in T1, T2, or T3

Decode for this encoding

d = UInt(Rd); setflags = FALSE; imm32 = ZeroExtend(i:imm3:imm8, 32);
 if d == 15 then UNPREDICTABLE;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<imm7>	Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "imm7" field as <imm7>/4.
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none">• For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285.• For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. For encoding T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.
<imm8>	Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as <imm8>/4.
<imm12>	Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
<const>	For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-2411 for the range of values. For encoding T3: an immediate value. See Modified immediate constants in T32 instructions on page F2-2409 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(SP, imm32, '0');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.8 ADD, ADDS (SP plus register)

Add to SP (register) adds an optionally-shifted register value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The ADDS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
 - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rdm>	Is the general-purpose destination and second source register, encoded in the "Rdm" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285 .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none">• For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285.• For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.
<Rm>	For encoding A1 and T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T3: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: LSL when type = 00 LSR when type = 01 ASR when type = 10 ROR when type = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(SP, shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.9 ADD (immediate, to PC)

Add to PC adds an immediate value to the $\text{Align}(\text{PC}, 4)$ value to form a PC-relative address, and writes the result to the destination register. ARM recommends that, where possible, software avoids using this alias

This instruction is an alias of the [ADR](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ADR](#).
- The description of [ADR](#) gives the operational pseudocode for this instruction.

A1

A1 variant

ADD{<c>}{<q>} <Rd>, PC, #<const>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is never the preferred disassembly.

T1

T1 variant

ADD{<c>}{<q>} <Rd>, PC, #<imm8>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is never the preferred disassembly.

T3

T3 variant

ADDW{<c>}{<q>} <Rd>, PC, #<imm12> // <Rd>, <imm12> can be represented in T1

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is never the preferred disassembly.

ADD{<c>}{<q>} <Rd>, PC, #<imm12>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is never the preferred disassembly.

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285 . For encoding T1 and T3: is the general-purpose destination register, encoded in the "Rd" field.
<label>	For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the ADR instruction to this label. If the offset is zero or positive, encoding A1 is used, with <code>imm32</code> equal to the offset. If the offset is negative, encoding A2 is used, with <code>imm32</code> equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of <code>imm32</code> . Permitted values of the size of the offset are any of the constants described in Modified immediate constants in A32 instructions on page F2-2411 . For encoding T1: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the ADR instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020. For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the ADR instruction to this label. If the offset is zero or positive, encoding T3 is used, with <code>imm32</code> equal to the offset. If the offset is negative, encoding T2 is used, with <code>imm32</code> equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of <code>imm32</code> . Permitted values of the size of the offset are 0-4095.
<imm8>	Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as <code><imm8>/4</code> .
<imm12>	Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
<const>	An immediate value. See Modified immediate constants in A32 instructions on page F2-2411 for the range of values.

Operation for all encodings

The description of [ADR](#) gives the operational pseudocode for this instruction.

F5.1.10 ADR

Form PC-relative address adds an immediate value to the PC value to form a PC-relative address, and writes the result to the destination register.

This instruction is used by the aliases [ADD \(immediate, to PC\)](#) and [SUB \(immediate, from PC\)](#). See [Alias conditions on page F5-2579](#) for details of when each alias is preferred.

Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label. If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset. If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are 0-4095.

The instruction aliases permit the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if d == 15 then // Can only occur for A32 encodings
        ALUWritePC(result);
    else
        R[d] = result;
```

F5.1.11 AND, ANDS (immediate)

Bitwise AND (immediate) performs a bitwise AND of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the ANDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.

For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] AND imm32;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

F5.1.12 AND, ANDS (register)

Bitwise AND (register) performs a bitwise AND of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

ANDS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 ANDS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TST (register);
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .								
<q>	See Standard assembler syntax fields on page F2-2396 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285. For the ANDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. <p>For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.</p>								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when type = 00</td> </tr> <tr> <td>LSR</td> <td>when type = 01</td> </tr> <tr> <td>ASR</td> <td>when type = 10</td> </tr> <tr> <td>ROR</td> <td>when type = 11</td> </tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.								

In T32 assembly:

- Outside an IT block, if ANDS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ANDS <Rd>, <Rn> had been written.
- Inside an IT block, if AND<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though AND<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else

```

```
        ALUWritePC(result);  
else  
    R[d] = result;  
    if setflags then  
        PSTATE.N = result<31>;  
        PSTATE.Z = IsZeroBit(result);  
        PSTATE.C = carry;  
        // PSTATE.V unchanged
```

F5.1.13 AND, ANDS (register-shifted register)

Bitwise AND (register-shifted register) performs a bitwise AND of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

Flag setting variant

Applies when S == 1.

ANDS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Not flag setting variant

Applies when S == 0.

AND{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
 - LSL when type = 00
 - LSR when type = 01
 - ASR when type = 10
 - ROR when type = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

F5.1.14 ASR (immediate)

Arithmetic Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

<Rm> Is the first general-purpose source register, encoded in the "Rm" field.

<Rs> Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

F5.1.16 ASRS (immediate)

Arithmetic Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores **PSTATE** from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the **MOV, MOVS (register)** instruction. This means that:

- The encodings in this description are named to match the encodings of **MOV, MOVS (register)**.
- The description of **MOV, MOVS (register)** gives the operational pseudocode for this instruction.

A1

MOVS, shift or rotate by value variant

T2

T2 variant

ASRS{<q>} {<Rd>}, <Rm>, #<imm> // Outside IT block

is equivalent to

MOVS{<q>} <Rd>, <Rm>, ASR #<imm>

and is the preferred disassembly when !InITBlock().

T3

MOVS, shift or rotate by value variant

ASRS.W {<Rd>,} <Rm>, #<imm> // Outside IT block, and <Rd>, <Rm>, <imm> can be represented in T2 is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>

and is always the preferred disassembly.

ASRS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>

and is always the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores [PSTATE](#) from `SPSR_<current_mode>`.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

<imm> For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as <imm> modulo 32.

Operation for all encodings

The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

F5.1.17 ASRS (register)

Arithmetic Shift Right, setting flags (register) shifts a register value right by a variable number of bits, shifting in copies of its sign bit, writes the result to the destination register, and updates the condition flags based on the result. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the [MOV, MOVS \(register-shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register-shifted register\)](#).
- The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0	0	0	1	1	0	1	1	(0)	(0)	(0)	(0)	Rd	Rs	0	1	0	1	Rm		
cond				S											type									

Flag setting variant

ASRS{<c>}{<q>} {<Rd>}, <Rm>, <Rs>

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>

and is always the preferred disassembly.

T1

15	14	13	12	11	10	9	6	5	3	2	0	
0	1	0	0	0	0	0	0	1	0	0	Rs	Rdm
op												

Arithmetic shift right variant

ASRS{<q>} {<Rdm>}, <Rdm>, <Rs> // Outside IT block

is equivalent to

MOVS{<q>} <Rdm>, <Rdm>, ASR <Rs>

and is the preferred disassembly when !InITBlock().

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	0	1	0	1	Rm	1	1	1	1	Rd	0	0	0	0	Rs			
type													S												

Flag setting variant

ASRS.W {<Rd>}, <Rm>, <Rs> // Outside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>

and is always the preferred disassembly.

ASRS{<c>}{<q>} {<Rd>, } <Rm>, <Rs>

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>

and is always the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rdm> Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> Is the first general-purpose source register, encoded in the "Rm" field.

<Rs> Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

T3 variant

B<c>.W <label> // Not permitted in IT block, and <label> can be represented in T1
 B<c>{<q>} <label> // Not permitted in IT block

Decode for this encoding

```
if cond<3:1> == '111' then SEE "Related encodings";
imm32 = SignExtend(S:J2:J1:imm6:imm11:'0', 32);
if InITBlock() then UNPREDICTABLE;
```

T4

T4 variant

B{<c>}.W <label> // <label> can be represented in T2
 B{<c>}{<q>} <label>

Decode for this encoding

```
I1 = NOT(J1 EOR S); I2 = NOT(J2 EOR S); imm32 = SignExtend(S:I1:I2:imm10:imm11:'0', 32);
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: [Branches and miscellaneous control on page F3-2461](#).

Assembler symbols

- <c> For encoding A1, T2 and T4: see [Standard assembler syntax fields on page F2-2396](#).
 For encoding T1: see [Standard assembler syntax fields on page F2-2396](#). Must not be AL or omitted.
 For encoding T3: see [Standard assembler syntax fields on page F2-2396](#). <c> must not be AL or omitted.
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <label> For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are multiples of 4 in the range –33554432 to 33554428.
 For encoding T1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –256 to 254.
 For encoding T2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –2048 to 2046.
 For encoding T3: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –1048576 to 1048574.

For encoding T4: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets `imm32` to that offset. Permitted offsets are even numbers in the range `-16777216` to `16777214`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    BranchWritePC(PC + imm32);
```

F5.1.19 BFC

Bit Field Clear clears any number of adjacent bits at any position in a register, without affecting the other bits in the register.

A1

31	28	27	26	25	24	23	22	21	20	16	15	12	11	7	6	5	4	3	2	1	0
!=1111				0	1	1	1	1	1	0	msb	Rd	lsb	0	0	1	1	1	1		
cond																					

A1 variant

BFC{<c>}{<q>} <Rd>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); msbit = UInt(msb); lsb = UInt(lsb);
if d == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	6	5	4	0
1	1	1	1	0	(0)	1	1	0	1	1	0	1	1	1	1	0	imm3	Rd	imm2	(0)	msb				

T1 variant

BFC{<c>}{<q>} <Rd>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); msbit = UInt(msb); lsb = UInt(imm3:imm2);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<lsb>	For encoding A1: is the least significant bit to be cleared, in the range 0 to 31, encoded in the "lsb" field. For encoding T1: is the least significant bit that is to be cleared, in the range 0 to 31, encoded in the "imm3:imm2" field.
<width>	Is the number of bits to be cleared, in the range 1 to 32-<lsb>, encoded in the "msb" field as <lsb>+<width>-1.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if msbit >= lsbit then
        R[d]<msbit:lsbit> = Replicate('0', msbit-lsbit+1);
        // Other bits of R[d] are unchanged
    else
        UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $msbit < lsbit$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

F5.1.20 BFI

Bit Field Insert copies any number of low order bits from a register into the same number of adjacent bits at any position in the destination register.

A1

A1 variant

BFI{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
if Rn == '1111' then SEE BFC;
d = UInt(Rd); n = UInt(Rn); msbit = UInt(msb); lsb = UInt(lsb);
if d == 15 then UNPREDICTABLE;
```

T1

T1 variant

BFI{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
if Rn == '1111' then SEE BFC;
d = UInt(Rd); n = UInt(Rn); msbit = UInt(msb); lsb = UInt(imm3:imm2);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the general-purpose source register, encoded in the "Rn" field.
- <lsb> For encoding A1: is the least significant destination bit, in the range 0 to 31, encoded in the "lsb" field.
For encoding T1: is the least significant destination bit, in the range 0 to 31, encoded in the "imm3:imm2" field.
- <width> Is the number of bits to be copied, in the range 1 to 32-<lsb>, encoded in the "msb" field as <lsb>+<width>-1.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if msbit >= lsbit then
        R[d]<msbit:lsbit> = R[n]<(msbit-lsbit):0>;
        // Other bits of R[d] are unchanged
    else
        UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $msbit < lsbit$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

F5.1.21 BIC, BICS (immediate)

Bitwise Bit Clear (immediate) performs a bitwise AND of a register value and the complement of an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-3819](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

BIC variant

Applies when `S == 0`.

`BIC{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

BICS variant

Applies when `S == 1`.

`BICS{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

BIC variant

Applies when `S == 0`.

`BIC{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

BICS variant

Applies when `S == 1`.

BICS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the BICS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.

For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  result = R[n] AND NOT(imm32);
  if d == 15 then // Can only occur for A32 encoding
    if setflags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);
  else
    R[d] = result;
    if setflags then
      PSTATE.N = result<31>;
      PSTATE.Z = IsZeroBit(result);
      PSTATE.C = carry;
      // PSTATE.V unchanged
```

F5.1.22 BIC, BICS (register)

Bitwise Bit Clear (register) performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-3819](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .								
<q>	See Standard assembler syntax fields on page F2-2396 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285. For the BICS variant, the instruction performs an exception return, that restores <code>PSTATE</code> from <code>SPSR_<current_mode></code>. <p>For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.</p>								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when type = 00</td> </tr> <tr> <td>LSR</td> <td>when type = 01</td> </tr> <tr> <td>ASR</td> <td>when type = 10</td> </tr> <tr> <td>ROR</td> <td>when type = 11</td> </tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.								

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
  
```

F5.1.23 BIC, BICS (register-shifted register)

Bitwise Bit Clear (register-shifted register) performs a bitwise AND of a register value and the complement of a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

F5.1.24 BKPT

Breakpoint causes a Breakpoint Instruction exception.

Breakpoint is always unconditional, even when inside an IT block.

A1

31	28	27	26	25	24	23	22	21	20	19					8	7	6	5	4	3	0
!=1111											imm12					0 1 1 1			imm4		
cond																					

A1 variant

BKPT{<q>} {#}<imm>

Decode for this encoding

```
imm16 = imm12:imm4;
if cond != '1110' then UNPREDICTABLE; // BKPT must be encoded with AL condition
```

CONSTRAINED UNPREDICTABLE behavior

If cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

15	14	13	12	11	10	9	8	7													0
1 0 1 1 1 1 1 0											imm8										

T1 variant

BKPT{<q>} {#}<imm>

Decode for this encoding

```
imm16 = ZeroExtend(imm8, 16);
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<q> See [Standard assembler syntax fields on page F2-2396](#). An BKPT instruction must be unconditional.

- <imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value:
- Is recorded in the Comment field of [ESR_ELx](#).ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
 - Is ignored otherwise.
- For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. This value:
- Is recorded in the Comment field of [ESR_ELx](#).ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
 - Is ignored otherwise.

Operation for all encodings

```
EncodingSpecificOperations();  
AArch32.SoftwreBreakpoint(imm16);
```

F5.1.25 BL, BLX (immediate)

Branch with Link calls a subroutine at a PC-relative address, and setting LR to the return address.

Branch with Link and Exchange Instruction Sets (immediate) calls a subroutine at a PC-relative address, setting LR to the return address, and changes the instruction set from A32 to T32, or from T32 to A32.

A1

A1 variant

BL{<c>}{<q>} <label>

Decode for this encoding

imm32 = [SignExtend](#)(imm24:'00', 32); targetInstrSet = [InstrSet_A32](#);

A2

A2 variant

BLX{<c>}{<q>} <label>

Decode for this encoding

imm32 = [SignExtend](#)(imm24:H:'0', 32); targetInstrSet = [InstrSet_T32](#);

T1

T1 variant

BL{<c>}{<q>} <label>

Decode for this encoding

I1 = NOT(J1 EOR S); I2 = NOT(J2 EOR S); imm32 = [SignExtend](#)(S:I1:I2:imm10:imm11:'0', 32);
 targetInstrSet = [InstrSet_T32](#);
 if [InITBlock](#)() && ![LastInITBlock](#)() then UNPREDICTABLE;

T2

T2 variant

```
BLX{<c>}{<q>} <label>
```

Decode for this encoding

```
if H == '1' then UNDEFINED;  
I1 = NOT(J1 EOR S); I2 = NOT(J2 EOR S); imm32 = SignExtend(S:I1:I2:imm10H:imm10L:'00', 32);  
targetInstrSet = InstrSet_A32;  
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> For encoding A1, T1 and T2: see [Standard assembler syntax fields on page F2-2396](#).
For encoding A2: see [Standard assembler syntax fields on page F2-2396](#). <c> must be AL or omitted.
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <label> For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are multiples of 4 in the range –33554432 to 33554428.
For encoding A2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset. Permitted offsets are even numbers in the range –33554432 to 33554430.
For encoding T1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding with imm32 set to that offset. Permitted offsets are even numbers in the range –16777216 to 16777214.
For encoding T2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the Align(PC, 4) value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset. Permitted offsets are multiples of 4 in the range –16777216 to 16777212.

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    if CurrentInstrSet() == InstrSet_A32 then  
        LR = PC - 4;  
    else  
        LR = PC<31:1> : '1';  
    if targetInstrSet == InstrSet_A32 then  
        targetAddress = Align(PC,4) + imm32;  
    else  
        targetAddress = PC + imm32;  
    SelectInstrSet(targetInstrSet);  
    BranchWritePC(targetAddress);
```

F5.1.26 BLX (register)

Branch with Link and Exchange (register) calls a subroutine at an address specified in the register, and if necessary changes to the instruction set indicated by bit[0] of the register value. If the value in bit[0] is 0, the instruction set after the branch will be A32. If the value in bit[0] is 1, the instruction set after the branch will be T32.

A1

A1 variant

BLX{<c>}{<q>} <Rm>

Decode for this encoding

m = UInt(Rm);
 if m == 15 then UNPREDICTABLE;

T1

T1 variant

BLX{<c>}{<q>} <Rm>

Decode for this encoding

m = UInt(Rm);
 if m == 15 then UNPREDICTABLE;
 if InITBlock() && !LastInITBlock() then UNPREDICTABLE;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    target = R[m];
    if CurrentInstrSet() == InstrSet_A32 then
        next_instr_addr = PC - 4;
        LR = next_instr_addr;
    else

```

```
next_instr_addr = PC - 2;  
LR = next_instr_addr<31:1> : '1';  
BXWritePC(target);
```

F5.1.27 BX

Branch and Exchange causes a branch to an address and instruction set specified by a register.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	0	
!=1111				0	0	0	1	0	0	1	0	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	0	0	0	1	Rm
cond																												

A1 variant

BX{<c>}{<q>} <Rm>

Decode for this encoding

m = UInt(Rm);

T1

15	14	13	12	11	10	9	8	7	6	3	2	1	0
0	1	0	0	0	1	1	1	0	Rm	(0)	(0)	(0)	

T1 variant

BX{<c>}{<q>} <Rm>

Decode for this encoding

m = UInt(Rm);
 if InITBlock() && !LastInITBlock() then UNPREDICTABLE;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rm> For encoding A1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The PC can be used.

For encoding T1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The PC can be used.

————— Note —————

If <Rm> is the PC at a non word-aligned address, it results in UNPREDICTABLE behavior because the address passed to the BXwritePC() pseudocode function has bits<1:0> = '10'.

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    BXWritePC(R[m]);
```

F5.1.28 BXJ

Branch and Exchange, previously Branch and Exchange Jazelle.

In ARMv8, BXJ behaves as a BX instruction, see [BX](#). This means it causes a branch to an address and instruction set specified by a register.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	0

cond																																	

A1 variant

BXJ{<c>}{<q>} <Rm>

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	1	1	1	1	0	0	Rm	1	0	(0)	0	(1)	(1)	(1)	(1)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)

T1 variant

BXJ{<c>}{<q>} <Rm>

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    BXWritePC(R[m]);
```

F5.1.29 CBNZ, CBZ

Compare and Branch on Nonzero and Compare and Branch on Zero compare the value in a register with zero, and conditionally branch forward a constant value. They do not affect the condition flags.

T1

15	14	13	12	11	10	9	8	7				3	2	0
1	0	1	1	op	0	i	1		imm5				Rn	

CBNZ variant

Applies when `op == 1`.

CBNZ{<q>} <Rn>, <label>

CBZ variant

Applies when `op == 0`.

CBZ{<q>} <Rn>, <label>

Decode for all variants of this encoding

```
n = UInt(Rn); imm32 = ZeroExtend(i:imm5:'0', 32); nonzero = (op == '1');
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rn> Is the general-purpose register to be tested, encoded in the "Rn" field.

<label> Is the program label to be conditionally branched to. Its offset from the PC, a multiple of 2 and in the range 0 to 126, is encoded as "i:imm5" times 4.

Operation

```
EncodingSpecificOperations();
if nonzero != IsZero(R[n]) then
    BranchWritePC(PC + imm32);
```

F5.1.30 CLREX

Clear-Exclusive clears the local monitor of the executing PE.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	0	1	0	1	1	1	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(0)	(0)	(0)	(0)	0	0	0	1	(1)	(1)	(1)	(1)

A1 variant

CLREX{<c>}{<q>}

Decode for this encoding

// No additional decoding required

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	1	1	1	0	1	1	(1)	(1)	(1)	(1)	1	0	(0)	0	(1)	(1)	(1)	(1)	0	0	1	0	(1)	(1)	(1)	(1)

T1 variant

CLREX{<c>}{<q>}

Decode for this encoding

// No additional decoding required

Notes for all encodings

For information about the **CONSTRAINED UNPREDICTABLE** behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F2-2396](#). Must be AL or omitted.
 For encoding T1: see [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    ClearExclusiveLocal(ProcessorID());
```

F5.1.31 CLZ

Count Leading Zeros returns the number of binary zero bits before the first binary one bit in a value.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
!=1111				0	0	0	1	0	1	1	0	(1)	(1)	(1)	(1)	Rd	(1)	(1)	(1)	(1)	0	0	0	1	Rm
cond																									

A1 variant

CLZ{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm);
 if d == 15 || m == 15 then UNPREDICTABLE;

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	1	0	1	1		Rn	1	1	1	1		Rd	1	0	0	0		Rm

T1 variant

CLZ{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); n = UInt(Rn);
 if m != n || d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as described, with no change to its behavior and no additional side-effects.
- The instruction executes with the additional decode: m = UInt(Rn);.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T1: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = CountLeadingZeroBits(R[m]);
    R[d] = result<31:0>;
```

F5.1.32 CMN (immediate)

Compare Negative (immediate) adds a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

CMN{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn); imm32 = A32ExpandImm(imm12);

T1

T1 variant

CMN{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn); imm32 = T32ExpandImm(i:imm3:imm8);
 if n == 15 then UNPREDICTABLE;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
 For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.
 For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], imm32, '0');
    PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.33 CMN (register)

Compare Negative (register) adds a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0	
!=1111				0	0	0	1	0	1	1	1	Rn	(0)	(0)	(0)	(0)	imm5	type	0	Rm			
cond																							

Rotate right with extend variant

Applies when imm5 == 00000 && type == 11.

CMN{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm5 == 00000 && type == 11).

CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = DecodeImmShift(type, imm5);

T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	1	0	1	1	Rm	Rn		

T1 variant

CMN{<c>}{<q>} <Rn>, <Rm>

Decode for this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = (SRTYPE_LSL, 0);

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	0	0	0	1	Rn	(0)	imm3	1	1	1	1	imm2	type	Rm					

Rotate right with extend variant

Applies when imm3 == 000 && imm2 == 00 && type == 11.

CMN{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm3 == 000 && imm2 == 00 && type == 11).

CMN{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1
CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);  
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);  
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: LSL when type = 00 LSR when type = 01 ASR when type = 10 ROR when type = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations();  
  shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);  
  (result, nzcV) = AddWithCarry(R[n], shifted, '0');  
  PSTATE.<N,Z,C,V> = nzcV;
```

F5.1.34 CMN (register-shifted register)

Compare Negative (register-shifted register) adds a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

CMN{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
 - LSL when type = 00
 - LSR when type = 01
 - ASR when type = 10
 - ROR when type = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
  EncodingSpecificOperations();
  shift_n = UInt(R[s]<7:0>);
  shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
  (result, nzcvc) = AddWithCarry(R[n], shifted, '0');
  PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.35 CMP (immediate)

Compare (immediate) subtracts an immediate value from a register value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

CMP{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn); imm32 = A32ExpandImm(imm12);

T1

T1 variant

CMP{<c>}{<q>} <Rn>, #<imm8>

Decode for this encoding

n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);

T2

T2 variant

CMP{<c>}.W <Rn>, #<const> // <Rd>, <const> can be represented in T1

CMP{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn); imm32 = T32ExpandImm(i:imm3:imm8);
 if n == 15 then UNPREDICTABLE;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
For encoding T1: is a general-purpose source register, encoded in the "Rn" field.
For encoding T2: is the general-purpose source register, encoded in the "Rn" field.
- <imm8> Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.
For encoding T2: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], NOT(imm32), '1');
    PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.36 CMP (register)

Compare (register) subtracts an optionally-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0	
!=1111				0	0	0	1	0	1	0	1	Rn	(0)	(0)	(0)	(0)	imm5	type	0	Rm			
cond																							

Rotate right with extend variant

Applies when imm5 == 00000 && type == 11.

CMP{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm5 == 00000 && type == 11).

CMP{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	1	0	1	0	Rm	Rn		

T1 variant

CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> both from R0-R7

Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

T2

15	14	13	12	11	10	9	8	7	6	3	2	0
0	1	0	0	0	1	0	1	N	Rm	Rn		

T2 variant

CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> not both from R0-R7

Decode for this encoding

```
n = UInt(N:Rn); m = UInt(Rm);
(shift_t, shift_n) = (SRTYPE_LSL, 0);
if n < 8 && m < 8 then UNPREDICTABLE;
if n == 15 || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n < 8$ && $m < 8$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as described, with no change to its behavior and no additional side-effects.
- The condition flags become UNKNOWN.

T3

Rotate right with extend variant

Applies when $imm3 == 000$ && $imm2 == 00$ && $type == 11$.

CMP{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when $!(imm3 == 000$ && $imm2 == 00$ && $type == 11)$.

CMP{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1 or T2
 CMP{<c>}{<q>} <Rn>, <Rm>, <shift> #<amount>

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
 For encoding T1 and T3: is the first general-purpose source register, encoded in the "Rn" field.
 For encoding T2: is the first general-purpose source register, encoded in the "N:Rn" field.
- <Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
 For encoding T1, T2 and T3: is the second general-purpose source register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
 LSL when type = 00

LSR when type = 01
ASR when type = 10
ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
  (result, nzc) = AddWithCarry(R[n], NOT(shifted), '1');
  PSTATE.<N,Z,C,V> = nzc;
```

F5.1.37 CMP (register-shifted register)

Compare (register-shifted register) subtracts a register-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0			
!=1111				0	0	0	1	0	1	0	1	Rn				(0)	(0)	(0)	(0)	Rs		0	type	1	Rm	
cond																										

A1 variant

CMP{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
 - LSL when type = 00
 - LSR when type = 01
 - ASR when type = 10
 - ROR when type = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.38 CPS, CPSID, CPSIE

Change PE State changes one or more of the `PSTATE.{A, I, F}` interrupt mask bits and, optionally, the `PSTATE.M` mode field, without changing any other `PSTATE` bits.

CPS is treated as NOP if executed in User mode unless it is defined as being `CONSTRAINED UNPREDICTABLE` elsewhere in this section.

The PE checks whether the value being written to `PSTATE.M` is legal. See *Illegal changes to PSTATE.M* on page G1-3793.

A1

if (imod == '00' && M == '0') || imod == '01' then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If `imod == '01'`, then one of the following behaviors must occur:

- The instruction is `UNDEFINED`.
- The instruction executes as a `NOP`.

If `imod == '00' && M == '0'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

If `mode != '00000' && M == '0'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: `changemode = TRUE;`
- The instruction executes as described, and the value specified by `mode` is ignored. There are no additional side effects.

If `imod<1> == '1' && A:I:F == '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction behaves as if `imod<1> == '0'`.
- The instruction behaves as if `A:I:F` has an UNKNOWN nonzero value.

If `imod<1> == '0' && A:I:F != '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction behaves as if `imod<1> == '1'`.
- The instruction behaves as if `A:I:F == '000'`.

T1

CPS variant

Applies when imod == 00 && M == 1.

CPS{<q>} #<mode> // Not permitted in IT block

CPSID variant

Applies when imod == 11 && M == 0.

CPSID.W <iflags> // Not permitted in IT block

CPSID variant

Applies when imod == 11 && M == 1.

CPSID{<q>} <iflags>, #<mode> // Not permitted in IT block

CPSIE variant

Applies when imod == 10 && M == 0.

CPSIE.W <iflags> // Not permitted in IT block

CPSIE variant

Applies when imod == 10 && M == 1.

CPSIE{<q>} <iflags>, #<mode> // Not permitted in IT block

Decode for all variants of this encoding

```

if imod == '00' && M == '0' then SEE "Hint instructions";
if mode != '00000' && M == '0' then UNPREDICTABLE;
if (imod<1> == '1' && A:I:F == '000') || (imod<1> == '0' && A:I:F != '000') then UNPREDICTABLE;
enable = (imod == '10'); disable = (imod == '11'); changemode = (M == '1');
affectA = (A == '1'); affectI = (I == '1'); affectF = (F == '1');
if imod == '01' || InITBlock() then UNPREDICTABLE;

```

CONSTRAINED UNPREDICTABLE behavior

If imod == '01', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

If mode != '00000' && M == '0', then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as a NOP.
- The instruction executes with the additional decode: `changemode = TRUE;`.
- The instruction executes as described, and the value specified by mode is ignored. There are no additional side effects.

If `imod<1> == '1' && A:I:F == '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction behaves as if `imod<1> == '0'`.
- The instruction behaves as if `A:I:F` has an UNKNOWN nonzero value.

If `imod<1> == '0' && A:I:F != '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction behaves as if `imod<1> == '1'`.
- The instruction behaves as if `A:I:F == '000'`.

Notes for all encodings

Hint instructions: In encoding T2, if the `imod` field is `00` and the `M` bit is `0`, a hint instruction is encoded. To determine which hint instruction, see [Branches and miscellaneous control on page F3-2461](#).

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<code><q></code>	See Standard assembler syntax fields on page F2-2396 .						
<code><iflags></code>	Is a sequence of one or more of the following, specifying which interrupt mask bits are affected: <table> <tr> <td><code>a</code></td> <td>Sets the A bit in the instruction, causing the specified effect on <code>PSTATE.A</code>, the asynchronous abort mask bit.</td> </tr> <tr> <td><code>i</code></td> <td>Sets the I bit in the instruction, causing the specified effect on <code>PSTATE.I</code>, the IRQ interrupt mask bit.</td> </tr> <tr> <td><code>f</code></td> <td>Sets the F bit in the instruction, causing the specified effect on <code>PSTATE.F</code>, the FIQ interrupt mask bit.</td> </tr> </table>	<code>a</code>	Sets the A bit in the instruction, causing the specified effect on <code>PSTATE.A</code> , the asynchronous abort mask bit.	<code>i</code>	Sets the I bit in the instruction, causing the specified effect on <code>PSTATE.I</code> , the IRQ interrupt mask bit.	<code>f</code>	Sets the F bit in the instruction, causing the specified effect on <code>PSTATE.F</code> , the FIQ interrupt mask bit.
<code>a</code>	Sets the A bit in the instruction, causing the specified effect on <code>PSTATE.A</code> , the asynchronous abort mask bit.						
<code>i</code>	Sets the I bit in the instruction, causing the specified effect on <code>PSTATE.I</code> , the IRQ interrupt mask bit.						
<code>f</code>	Sets the F bit in the instruction, causing the specified effect on <code>PSTATE.F</code> , the FIQ interrupt mask bit.						
<code><mode></code>	Is the number of the mode to change to, in the range 0 to 31, encoded in the "mode" field.						

Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
  EncodingSpecificOperations();
  if PSTATE.EL != EL0 then
    if enable then
      if affectA then PSTATE.A = '0';
      if affectI then PSTATE.I = '0';
      if affectF then PSTATE.F = '0';
    if disable then
      if affectA then PSTATE.A = '1';
      if affectI then PSTATE.I = '1';
      if affectF then PSTATE.F = '1';
  
```

```
    if changemode then
        // WriteMode will set PSTATE.IL if 'mode' is not legal.
        AArch32.WriteMode(mode);
else
    EncodingSpecificOperations();
    if PSTATE.EL != EL0 then
        if enable then
            if affectA then PSTATE.A = '0';
            if affectI then PSTATE.I = '0';
            if affectF then PSTATE.F = '0';
        if disable then
            if affectA then PSTATE.A = '1';
            if affectI then PSTATE.I = '1';
            if affectF then PSTATE.F = '1';
        if changemode then
            // WriteMode will set PSTATE.IL if 'mode' is not legal.
            AArch32.WriteMode(mode);
```

F5.1.39 CRC32

CRC32 performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x04C11DB7 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction.

———— **Note** ————

[ID_ISAR5](#).CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

A1

CRC32B variant

Applies when `sz == 00`.

CRC32B{<q>} <Rd>, <Rn>, <Rm>

CRC32H variant

Applies when `sz == 01`.

CRC32H{<q>} <Rd>, <Rn>, <Rm>

CRC32W variant

Applies when `sz == 10`.

CRC32W{<q>} <Rd>, <Rn>, <Rm>

Decode for all variants of this encoding

```

if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if cond != '1110' then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If `size == 64`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: `size = 32`.

If `cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0

C

CRC32B variant

Applies when `sz == 00`.

CRC32B{<q>} <Rd>, <Rn>, <Rm>

CRC32H variant

Applies when `sz == 01`.

CRC32H{<q>} <Rd>, <Rn>, <Rm>

CRC32W variant

Applies when `sz == 10`.

CRC32W{<q>} <Rd>, <Rn>, <Rm>

Decode for all variants of this encoding

```

if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If `size == 64`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: `size = 32;`.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <q> See *Standard assembler syntax fields* on page F2-2396. An CRC32 instruction must be unconditional.
- <Rd> Is the general-purpose accumulator output register, encoded in the "Rd" field.
- <Rn> Is the general-purpose accumulator input register, encoded in the "Rn" field.
- <Rm> Is the general-purpose data source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    acc = R[n];           // accumulator
    val = R[m]<size-1:0>; // input value
    poly = (if crc32c then 0x1EDC6F41 else 0x04C11DB7)<31:0>;
    tempacc = BitReverse(acc):Zeros(size);
    tempval = BitReverse(val):Zeros(32);
    // Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
    R[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
```

F5.1.40 CRC32C

CRC32C performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x1EDC6F41 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction.

———— **Note** ————

[ID_ISAR5](#).CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if cond != '1110' then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If size == 64, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: size = 32;.

If cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

CRC32CB variant

Applies when `sz == 00`.

CRC32CB{<q>} <Rd>, <Rn>, <Rm>

CRC32CH variant

Applies when `sz == 01`.

CRC32CH{<q>} <Rd>, <Rn>, <Rm>

CRC32CW variant

Applies when `sz == 10`.

CRC32CW{<q>} <Rd>, <Rn>, <Rm>

Decode for all variants of this encoding

```

if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If `size == 64`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: `size = 32`;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <q> See [Standard assembler syntax fields on page F2-2396](#). An CRC32C instruction must be unconditional.
- <Rd> Is the general-purpose accumulator output register, encoded in the "Rd" field.
- <Rn> Is the general-purpose accumulator input register, encoded in the "Rn" field.
- <Rm> Is the general-purpose data source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    acc = R[n];           // accumulator
    val = R[m]<size-1:0>; // input value
    poly = (if crc32c then 0x1EDC6F41 else 0x04C11DB7)<31:0>;
    tempacc = BitReverse(acc):Zeros(size);
    tempval = BitReverse(val):Zeros(32);
    // Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
    R[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
```

F5.1.41 DBG

Debug Hint provides a hint to debug and related systems. See the system documentation for what use (if any) is made of this instruction.

<option> Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "option" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Hint_Debug(option);
```

F5.1.42 DCPS1, DCPS2, DCPS3

Debug Change PE State allows the debugger to move the PE into a higher Exception Level or to a specific mode at the current Exception Level.

These instructions are always UNDEFINED in Non-debug state.

DCPS1 targets EL1 and:

- If EL1 is using AArch32, the PE enters SVC mode. If EL3 is using AArch32, Secure SVC is an EL3 mode. This means DCPS1 causes the PE to enter EL3.
- If EL1 is using AArch64, the PE enters EL1h, and executes future instructions as A64 instructions.

DCPS2 targets EL2 and:

- If EL2 is using AArch32, the PE enters Hyp mode.
- If EL2 is using AArch64, the PE enters EL2h, and executes future instructions as A64 instructions.

DCPS3 targets EL3 and:

- If EL3 is using AArch32, the PE enters Monitor mode.
- If EL3 is using AArch64, the PE enters EL3h, and executes future instructions as A64 instructions.

For more information on the operation of these instructions, see [DCPS<n>](#) on page H2-4861.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F2-2396](#). Must be AL or omitted.
 For encoding T1: see [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <option> Specifies an optional limitation on the barrier operation. Values are:
 - SY Full system is the required shareability domain, reads and writes are the required access types in both [Group A](#) and [Group B](#). Can be omitted. This option is referred to as the full system DMB. Encoded as option = 0b1111.
 - ST Full system is the required shareability domain, writes are the required access type in both [Group A](#) and [Group B](#). SYST is a synonym for ST. Encoded as option = 0b1110.
 - LD Full system is the required shareability domain, reads are the required access type in [Group A](#), and reads and writes are the required access types in [Group B](#). Encoded as option = 0b1101.
 - ISH Inner Shareable is the required shareability domain, reads and writes are the required access types in both [Group A](#) and [Group B](#). Encoded as option = 0b1011.

ISHST	Inner Shareable is the required shareability domain, writes are the required access type in both Group A and Group B . Encoded as option = 0b1010.
ISHLD	Inner Shareable is the required shareability domain, reads are the required access type in Group A , and reads and writes are the required access types in Group B . Encoded as option = 0b1001.
NSH	Non-shareable is the required shareability domain, reads and writes are the required access types in both Group A and Group B . Encoded as option = 0b0111.
NSHST	Non-shareable is the required shareability domain, writes are the required access type in both Group A and Group B . Encoded as option = 0b0110.
NSHLD	Non-shareable is the required shareability domain, reads are the required access type in Group A , and reads and writes are the required access types in Group B . Encoded as option = 0b0101.
OSH	Outer Shareable is the required shareability domain, reads and writes are the required access types in both Group A and Group B . Encoded as option = 0b0011.
OSHST	Outer Shareable is the required shareability domain, writes are the required access type in both Group A and Group B . Encoded as option = 0b0010.
OSHLD	Outer Shareable is the required shareability domain, reads are the required access type in Group A , and reads and writes are the required access types in Group B . Encoded as option = 0b0001.

All other encodings of option are reserved. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system barrier operation, but software must not rely on this behavior.

Note

The instruction supports the following alternative <option> values, but ARM recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST is an alias for NSHST.

Operation for all encodings

```

```
domain = MReqDomain_InnerShareable;  
DataSynchronizationBarrier(domain, types);
```

F5.1.45 EOR, EORS (immediate)

Bitwise Exclusive OR (immediate) performs a bitwise Exclusive OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
 - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

EOR variant

Applies when S == 0.

EOR{<c>}{<q>} {<Rd>}, <Rn>, #<const>

EORS variant

Applies when S == 1.

EORS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

EOR variant

Applies when S == 0.

EOR{<c>}{<q>} {<Rd>}, <Rn>, #<const>

EORS variant

Applies when S == 1 && Rd != 1111.

EORS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TEQ (immediate);
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285. For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. <p>For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.</p>
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. <p>For encoding T1: is the general-purpose source register, encoded in the "Rn" field.</p>
<const>	For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-2411 for the range of values. <p>For encoding T1: an immediate value. See Modified immediate constants in T32 instructions on page F2-2409 for the range of values.</p>

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  result = R[n] EOR imm32;
  if d == 15 then // Can only occur for A32 encoding
    if setflags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);
  else
    R[d] = result;
    if setflags then
      PSTATE.N = result<31>;
      PSTATE.Z = IsZeroBit(result);
      PSTATE.C = carry;
      // PSTATE.V unchanged
```

F5.1.46 EOR, EORS (register)

Bitwise Exclusive OR (register) performs a bitwise Exclusive OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

EOR{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

EOR, shift or rotate by value variant

Applies when S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11).

EOR<c>.W {<Rd>}, <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 EOR{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

EORS, rotate right with extend variant

Applies when S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && type == 11.

EORS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

EORS, shift or rotate by value variant

Applies when S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111.

EORS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 EORS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TEQ (register);
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none">For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285.For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: LSL when type = 00 LSR when type = 01 ASR when type = 10 ROR when type = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if EORS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EORS <Rd>, <Rn> had been written
- Inside an IT block, if EOR<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EOR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

```
        ALUwritePC(result);  
else  
    R[d] = result;  
    if setflags then  
        PSTATE.N = result<31>;  
        PSTATE.Z = IsZeroBit(result);  
        PSTATE.C = carry;  
        // PSTATE.V unchanged
```

F5.1.47 EOR, EORS (register-shifted register)

Bitwise Exclusive OR (register-shifted register) performs a bitwise Exclusive OR of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

Flag setting variant

Applies when S == 1.

EORS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Not flag setting variant

Applies when S == 0.

EOR{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
 - LSL when type = 00
 - LSR when type = 01
 - ASR when type = 10
 - ROR when type = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

F5.1.48 ERET

Exception Return.

The PE branches to the address held in the register holding the preferred return address, and restores [PSTATE](#) from `SPSR_<current_mode>`.

The register holding the preferred return address is:

- `ELR_hyp`, when executing in Hyp mode.
- `LR`, when executing in a mode other than Hyp mode, User mode, or System mode.

The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state on page G1-3819*.

Exception Return is **CONSTRAINED UNPREDICTABLE** in User mode and System mode.

In Debug state, the T1 encoding of ERET is decoded as DRPS.

T1 variant

ERET{<c>}{<q>}

Decode for this encoding

if `InITBlock()` && `!LastInITBlock()` then UNPREDICTABLE;

Notes for all encodings

For information about the **CONSTRAINED UNPREDICTABLE** behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See *Standard assembler syntax fields on page F2-2396*.

<q> See *Standard assembler syntax fields on page F2-2396*.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
if PSTATE.M IN {M32_User,M32_System} then
    UNPREDICTABLE; // UNDEFINED or NOP
else
    new_pc_value = if PSTATE.EL == EL2 then ELR_hyp else R[14];
    AArch32.ExceptionReturn(new_pc_value, SPSR[]);
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

F5.1.49 HLT

Halting breakpoint causes a software breakpoint to occur.

Halting breakpoint is always unconditional, even inside an IT block.

A1

A1 variant

HLT{<q>} {#}<imm>

Decode for this encoding

```
if EDSCR.HDE == '0' || !HaltingAllowed() then UNDEFINED;
if cond != '1110' then UNPREDICTABLE; // HLT must be encoded with AL condition
```

CONSTRAINED UNPREDICTABLE behavior

If cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

T1 variant

HLT{<q>} {#}<imm>

Decode for this encoding

```
if EDSCR.HDE == '0' || !HaltingAllowed() then UNDEFINED;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <q> See [Standard assembler syntax fields on page F2-2396](#). An HLT instruction must be unconditional.
- <imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

For encoding T1: is a 6-bit unsigned immediate, in the range 0 to 63, encoded in the "imm6" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

Operation for all encodings

```
EncodingSpecificOperations();  
Halt(DebugHalt_HaltInstruction);
```

F5.1.50 HVC

Hypervisor Call causes a Hypervisor Call exception. For more information see [Hypervisor Call \(HVC\) exception on page G1-3839](#). Non-secure software executing at EL1 can use this instruction to call the hypervisor to request a service.

The HVC instruction is:

- UNDEFINED in Secure state, and in User mode in Non-secure state.
- When SCR.HCE is set to 0, UNDEFINED in Non-secure EL1 modes and CONSTRAINED UNPREDICTABLE in Hyp mode.

On executing an HVC instruction, the HSR reports the exception as a Hypervisor Call exception, using the EC value 0x12, and captures the value of the immediate argument, see [Use of the HSR on page G4-4123](#).

A1

A1 variant

HVC{<q>} {#}<imm16>

Decode for this encoding

```
if cond != '1110' then UNPREDICTABLE;
imm16 = imm12:imm4;
```

CONSTRAINED UNPREDICTABLE behavior

If cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

T1 variant

HVC{<q>} {#}<imm16>

Decode for this encoding

```
imm16 = imm4:imm12;
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#), and in particular, *HVC* on page K1-5467.

Assembler symbols

- <q> See [Standard assembler syntax fields on page F2-2396](#). An HVC instruction must be unconditional.
- <imm16> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is for assembly and disassembly only. It is reported in the HSR but otherwise is ignored by hardware. An HVC handler might interpret imm16, for example to determine the required service.
- For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. This value is for assembly and disassembly only. It is reported in the HSR but otherwise is ignored by hardware. An HVC handler might interpret imm16, for example to determine the required service.

Operation for all encodings

```
EncodingSpecificOperations();
if !HaveEL(EL2) || PSTATE.EL == EL0 || IsSecure() then
    UNDEFINED;

if HaveEL(EL3) then
    if ELUsingAArch32(EL3) && SCR.HCE == '0' && PSTATE.EL == EL2 then
        UNPREDICTABLE;
    else
        hvc_enable = SCR_GEN[].HCE;
else
    hvc_enable = if ELUsingAArch32(EL3) then NOT(HCR_EL2.HCD) else NOT(HCR.HCD);

if hvc_enable == '0' then
    UNDEFINED;
else
    AArch32.CallHypervisor(imm16);
```

CONSTRAINED UNPREDICTABLE behavior

If `ELUsingAArch32(EL3) && SCR.HCE == '0' && PSTATE.EL == EL2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

F5.1.51 ISB

Instruction Synchronization Barrier flushes the pipeline in the PE, so that all instructions following the ISB are fetched from cache or memory, after the instruction has been completed. It ensures that the effects of context changing operations executed before the ISB instruction are visible to the instructions fetched after the ISB. Context changing operations include changing the Address Space Identifier (ASID), TLB maintenance instructions, branch predictor maintenance operations, and all changes to the System registers.

In addition, any branches that appear in program order after the ISB instruction are written into the branch prediction logic with the context that is visible after the ISB instruction. This is needed to ensure correct execution of the instruction stream.

For more information, see [Instruction Synchronization Barrier \(ISB\)](#) on page E2-2325.

T1 variant

ISB{<c>}{<q>} {<option>}

Decode for this encoding

// No additional decoding required

Notes for all encodings

For information about the **CONSTRAINED UNPREDICTABLE** behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields](#) on page F2-2396. Must be AL or omitted.
For encoding T1: see [Standard assembler syntax fields](#) on page F2-2396.
- <q> See [Standard assembler syntax fields](#) on page F2-2396.
- <option> Specifies an optional limitation on the barrier operation. Values are:
 - SY Full system barrier operation, encoded as option = 0b1111. Can be omitted.
 All other encodings of option are reserved. The corresponding instructions execute as full system barrier operations, but must not be relied upon by software.

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    InstructionSynchronizationBarrier();
```

F5.1.52 IT

If-Then makes up to four following instructions (the IT block) conditional. The conditions for the instructions in the IT block are the same as, or the inverse of, the condition the IT instruction specifies for the first instruction in the block.

The IT instruction itself does not affect the condition flags, but the execution of the instructions in the IT block can change the condition flags.

16-bit instructions in the IT block, other than CMP, CMN and TST, do not set the condition flags. An IT instruction with the AL condition can change the behavior without conditional execution.

The architecture permits exception return to an instruction in the IT block only if the restoration of the CPSR restores ITSTATE to a state consistent with the conditions specified by the IT instruction. Any other exception return to an instruction in an IT block is UNPREDICTABLE. Any branch to a target instruction in an IT block is not permitted, and if such a branch is made it is UNPREDICTABLE what condition is used when executing that target instruction and any subsequent instruction in the IT block.

See also [Conditional instructions on page F1-2359](#) and [Conditional execution on page F2-2397](#).

T1

15	14	13	12	11	10	9	8	7	4	3	0
1	0	1	1	1	1	1	1	firstcond	!=0000		

mask

T1 variant

IT{<x>{<y>{<z>}}}{<q>} <cond>

Decode for this encoding

```
if mask == '0000' then SEE "Related encodings";
if firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1) then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If firstcond == '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as if firstcond = '1110'. This does not apply if BitCount(mask) != 1.

If firstcond == '1110' && BitCount(mask) != 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: [Miscellaneous 16-bit instructions on page F3-2432](#).

Assembler symbols

<x> The condition for the second instruction in the IT block. If omitted, the "mask" field is set to 0b1000. If present it is encoded in the "mask[3]" field:

T	firstcond[0]
E	NOT firstcond[0]

<y> The condition for the third instruction in the IT block. If omitted and <x> is present, the "mask[2:0]" field is set to 0b100. If <y> is present it is encoded in the "mask[2]" field:

T	firstcond[0]
E	NOT firstcond[0]

<z> The condition for the fourth instruction in the IT block. If omitted and <y> is present, the "mask[1:0]" field is set to 0b10. If <z> is present, the "mask[0]" field is set to 1, and it is encoded in the "mask[1]" field:

T	firstcond[0]
E	NOT firstcond[0]

<q> See [Standard assembler syntax fields on page F2-2396](#).

<cond> The condition for the first instruction in the IT block, encoded in the "firstcond" field. See [Table F2-1 on page F2-2397](#) for the range of conditions available, and the encodings.

The conditions specified in an IT instruction must match those specified in the syntax of the instructions in its IT block. When assembling to A32 code, assemblers check IT instruction syntax for validity but do not generate assembled instructions for them. See [Conditional instructions on page F1-2359](#).

Operation

```
EncodingSpecificOperations();  
AArch32.CheckITEnabled(mask);  
PSTATE.IT<7:0> = firstcond:mask;
```

F5.1.53 LDA

Load-Acquire Word loads a word from memory and writes it to a register. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89

Decode for this encoding

t = UInt(Rt); n = UInt(Rn);
 if t == 15 || n == 15 then UNPREDICTABLE;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields](#) on page F2-2396.
- <q> See [Standard assembler syntax fields](#) on page F2-2396.
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address, 4);
    R[t] = Mem0[address, 4];
```

F5.1.56 LDAEXB

Load-Acquire Exclusive Byte loads a byte from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page B2-89.

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-2345. For information about memory accesses see [Memory accesses](#) on page F2-2401.

LDAEXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

t = UInt(Rt); t2 = t + 1; n = UInt(Rn);
 if Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction operates without any change to its behavior.

T1

    R[t] = ZeroExtend(Mem0[address, 2], 32);
```

F5.1.60 LDC (immediate)

Load data to System register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to the **DBGDTRXint** System register. It can use offset, post-indexed, pre-indexed, or unindexed addressing. For information about memory accesses see [Memory accesses on page F2-2401](#).

In an implementation that includes EL2, the permitted LDC access to **DBGDTRXint** can be trapped to Hyp mode, meaning that an attempt to execute an LDC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [Trapping general Non-secure System register accesses to debug registers on page G1-3895](#).

For simplicity, the LDC pseudocode does not show this possible trap to Hyp mode.

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDC{<c>}{<q>} p14, c5, [<Rn>{, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 1$.

LDC{<c>}{<q>} p14, c5, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDC{<c>}{<q>} p14, c5, [<Rn>, #<+/-><imm>]!

Unindexed variant

Applies when $P == 0 \ \&\& \ U == 1 \ \&\& \ W == 0$.

LDC{<c>}{<q>} p14, c5, [<Rn>], <option>

Decode for all variants of this encoding

```

if Rn == '1111' then SEE LDC (literal);
if P == '0' && U == '0' && W == '0' then UNDEFINED;
n = UInt(Rn); cp = 14;
imm32 = ZeroExtend(imm8:'00', 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
```

T1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDC{<c>}{<q>} p14, c5, [<Rn>{, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 1$.

LDC{<c>}{<q>} p14, c5, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDC{<c>}{<q>} p14, c5, [<Rn>, #<+/-><imm>]!

Unindexed variant

Applies when $P == 0 \ \&\& \ U == 1 \ \&\& \ W == 0$.

LDC{<c>}{<q>} p14, c5, [<Rn>], <option>

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDC (literal);
if P == '0' && U == '0' && W == '0' then UNDEFINED;
n = UInt(Rn); cp = 14;
imm32 = ZeroExtend(imm8:'00', 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
```

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F2-2396.				
<q>	See <i>Standard assembler syntax fields</i> on page F2-2396.				
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see LDC (literal) .				
<option>	Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.				
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <table style="margin-left: 2em;"> <tr> <td>-</td> <td>when U = 0</td> </tr> <tr> <td>+</td> <td>when U = 1</td> </tr> </table>	-	when U = 0	+	when U = 1
-	when U = 0				
+	when U = 1				
<imm>	Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.				

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  AArch32.CheckSystemAccess(cp, ThisInstr());
  offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
  address = if index then offset_addr else R[n];

  // System register write to DBGDTRTXint.
  DBGDTR_EL0[] = MemA[address,4];

  if wback then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If $W == '1' \ || \ P == '0'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes without writeback.
- The instruction executes as LDC (immediate) with writeback to the PC. The instruction is handled as described in [Using R15 on page K1-5447](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<option>	Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.
<label>	The label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, <code>imm32</code> is equal to the offset and <code>add == TRUE</code> (encoded as <code>U == 1</code>). If the offset is negative, <code>imm32</code> is equal to minus the offset and <code>add == FALSE</code> (encoded as <code>U == 0</code>).
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when <code>U = 0</code> + when <code>U = 1</code>
<imm>	Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <code><imm>/4</code> .

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    offset_addr = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    address = if index then offset_addr else Align(PC,4);

    // System register write to DBGDTRXint.
    DBGDTR_EL0[] = MemA[address,4];
```

F5.1.62 LDM, LDMIA, LDMFD

Load Multiple (Increment After, Full Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the highest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).

Related system instructions are [LDM \(User registers\)](#) and [LDM \(exception return\)](#).

This instruction is used by the alias [POP \(multiple registers\)](#). See [Alias conditions on page F5-2690](#) for details of when each alias is preferred.

A1

A1 variant

LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If $\text{wback} \ \&\& \ \text{registers}\langle n \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

15	14	13	12	11	10	8	7					0
1	1	0	0	1	Rn	register_list						

T1 variant

LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

Decode for this encoding

```
n = UInt(Rn); registers = '00000000':register_list; wback = (registers<n> == '0');
if BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12					0
1	1	1	0	1	0	0	0	1	0	W	1	Rn	P	M	(0)	register_list						

register_list<13>

T2 variant

LDM{IA}{<c>}.W <Rn>{!}, <registers> // Preferred syntax, if <Rn>, '!' and <registers> can be represented in T1
 LDMFD{<c>}.W <Rn>{!}, <registers> // Alternate syntax, Full Descending stack, if <Rn>, '!' and <registers> can be represented in T1
 LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<13> == '1' then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If $\text{BitCount}(\text{registers}) == 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads a single register using the specified addressing modes.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If $\text{registers}_{\langle 13 \rangle} == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

If $P == '1' \ \&\& \ M == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Alias conditions

Alias	is preferred when
POP (multiple registers)	$W == '1' \ \&\& \ Rn == '1101' \ \&\& \ \text{BitCount}(\text{register_list}) > 1$

Assembler symbols

IA	Is an optional suffix for the Increment After form.
<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	For encoding A1 and T2: the address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0. For encoding T1: the address adjusted by the size of the data loaded is written back to the base register. It is omitted if <Rn> is included in <registers>, otherwise it must be present.

<registers> For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.

For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field.

For encoding T2: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0. If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4]; address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] + 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

F5.1.63 LDM (exception return)

Load Multiple (exception return) loads multiple registers from consecutive memory locations using an address from a base register. The **SPSR** of the current mode is copied to the **CPSR**. An address adjusted by the size of the data loaded can optionally be written back to the base register.

The registers loaded include the PC. The word loaded for the PC is treated as an address and a branch occurs to that address.

Load Multiple (exception return) is:

- UNDEFINED in Hyp mode.
- UNPREDICTABLE in debug state, and in User mode and System mode.

A1

A1 variant

LDM{<amode>}{<c>}{<q>} <Rn>{!}, <registers_with_pc>^

Decode for this encoding

```
n = UInt(Rn); registers = register_list;
wback = (W == '1'); increment = (U == '1'); wordhigher = (P == U);
if n == 15 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all the loads using the specified addressing mode and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during the execution of this instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<amode>	is one of:	
	DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
	FA	Full Ascending. For this instruction, a synonym for DA.
	DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
	EA	Empty Ascending. For this instruction, a synonym for DB.

IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
FD	Full Descending. For this instruction, a synonym for IA.
IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
ED	Empty Descending. For this instruction, a synonym for IB.

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers_with_pc> Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must be specified in the register list, and the instruction causes a branch to the address (data) loaded into the PC. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

Instructions with similar syntax but without the PC included in the registers list are described in [LDM \(User registers\)](#).

Operation

```

if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elseif PSTATE.M IN {M32_User, M32_System} then
        UNPREDICTABLE; // UNDEFINED or NOP
    else
        length = 4*BitCount(registers) + 4;
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;

        for i = 0 to 14
            if registers<i> == '1' then
                R[i] = MemA[address,4]; address = address + 4;
            new_pc_value = MemA[address,4];

        if wback && registers<n> == '0' then R[n] = if increment then R[n]+length else R[n]-length;
        if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;

        AArch32.ExceptionReturn(new_pc_value, SPSR[]);
  
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User, M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

F5.1.64 LDM (User registers)

In an EL1 mode other than System mode, Load Multiple (User registers) loads multiple User mode registers from consecutive memory locations using an address from a base register. The registers loaded cannot include the PC. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Load Multiple (User registers) is UNDEFINED in Hyp mode, and UNPREDICTABLE in User and System modes.

A1

A1 variant

LDM{<amode>}{<c>}{<q>} <Rn>, <registers_without_pc>^

Decode for this encoding

```
n = UInt(Rn); registers = register_list; increment = (U == '1'); wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<amode>	is one of:	
	DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
	FA	Full Ascending. For this instruction, a synonym for DA.
	DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
	EA	Empty Ascending. For this instruction, a synonym for DB.
	IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
	FD	Full Descending. For this instruction, a synonym for IA.
	IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
	ED	Empty Descending. For this instruction, a synonym for IB.

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

<registers_without_pc>

Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded by the LDM instruction. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must not be in the register list. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

Instructions with similar syntax but with the PC included in <registers_without_pc> are described in [LDM \(exception return\)](#).

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then UNDEFINED;
    elseif PSTATE.M IN {M32_User,M32_System} then UNPREDICTABLE;
    else
        length = 4*BitCount(registers);
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;
        for i = 0 to 14
            if registers<i> == '1' then // Load User mode register
                Rmode[i, M32_User] = MemA[address,4]; address = address + 4;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

F5.1.65 LDMDA, LDMFA

Load Multiple Decrement After (Full Ascending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).

Related system instructions are [LDM \(User registers\)](#) and [LDM \(exception return\)](#).

A1

A1 variant

LMDA{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 LDMFA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Ascending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

- <q> See *Standard assembler syntax fields* on page F2-2396.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4]; address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] - 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

F5.1.66 LDMDB, LDMEA

Load Multiple Decrement Before (Empty Ascending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).

Related system instructions are [LDM \(User registers\)](#) and [LDM \(exception return\)](#).

A1

A1 variant

LDMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 LDMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

T1

T1 variant

```
LDMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax  
LDMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');  
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;  
if wback && registers<n> == '1' then UNPREDICTABLE;  
if registers<13> == '1' then UNPREDICTABLE;  
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `wback && registers<n> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If `BitCount(registers) < 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If `BitCount(registers) == 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction loads a single register using the specified addressing modes.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If `registers<13> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

If `P == '1' && M == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.
- For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0. If the PC is in the list:
- The LR must not be in the list.
 - The instruction must be either outside any IT block, or the last instruction in an IT block.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4]; address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] - 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4]; address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] + 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

F5.1.68 LDR (immediate)

Load Register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses](#) on page F2-2401.

This instruction is used by the alias [POP \(single register\)](#). See [Alias conditions](#) on page F5-2705 for details of when each alias is preferred.

A1

Offset variant

Applies when P == 1 && W == 0.

LDR{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 0.

LDR{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDR{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE LDR (literal);
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if wback && n == t then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDR{<c>}{<q>} <Rt>, [<Rn> {, #+<imm>}]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm5:'00', 32);
 index = TRUE; add = TRUE; wback = FALSE;

T2

T2 variant

LDR{<c>}{<q>} <Rt>, [SP{, #+<imm>}]

Decode for this encoding

t = UInt(Rt); n = 13; imm32 = ZeroExtend(imm8:'00', 32);
 index = TRUE; add = TRUE; wback = FALSE;

T3

T3 variant

LDR{<c>}.W <Rt>, [<Rn> {, #+<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1 or T2
 LDR{<c>}{<q>} <Rt>, [<Rn> {, #+<imm>}]

Decode for this encoding

if Rn == '1111' then SEE LDR (literal);
 t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); index = TRUE; add = TRUE;
 wback = FALSE; if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;

T4

Offset variant

Applies when P == 1 && U == 0 && W == 0.

LDR{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

LDR{<c>}{<q>} <Rt>, [<Rn>], #+/-<imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDR{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDR (literal);
if P == '1' && U == '1' && W == '0' then SEE LDRT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn);
imm32 = ZeroExtend(imm8, 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
if (wback && n == t) || (t == 15 && InITBlock() && !LastInITBlock()) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Alias conditions

Alias	of variant	is preferred when
POP (single register)	A1 (post-indexed)	P == '0' && U == '1' && W == '0' && Rn == '1101' && imm12 == '00000000100'
POP (single register)	T4 (post-indexed)	Rn == '1101' && U == '1' && imm8 == '00000100'

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285 . For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field. For encoding T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285 .
<Rn>	For encoding A1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDR (literal) . For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
 For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4.
 For encoding T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 and encoded in the "imm8" field as <imm>/4.
 For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
 For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,4];
    if wback then R[n] = offset_addr;
    if t == 15 then
      if address<1:0> == '00' then
        LoadWritePC(data);
      else
        UNPREDICTABLE;
    else
      R[t] = data;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,4];
    if wback then R[n] = offset_addr;
    if t == 15 then
      if address<1:0> == '00' then
        LoadWritePC(data);
      else
        UNPREDICTABLE;
    else
      R[t] = data;
  
```

F5.1.69 LDR (literal)

Load Register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses see [Memory accesses](#) on page F2-2401.

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ W == 1)$.

LDR{<c>}{<q>} <Rt>, <label> // Normal form
 LDR{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if wback then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: wback = FALSE;.
- The instruction treats bit[24] as the P bit, and bit[21] as the W bit, and uses the same addressing mode as described in [LDR \(immediate\)](#). The instruction uses post-indexed addressing when $P == '0'$ and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15](#) on page K1-5447.

T1

T1 variant

LDR{<c>}{<q>} <Rt>, <label> // Normal form

Decode for this encoding

```
t = UInt(Rt); imm32 = ZeroExtend(imm8:'00', 32); add = TRUE;
```

T2

T2 variant

```
LDR{<c>}.W <Rt>, <label> // Preferred syntax, and <Rt>, <label> can be represented in T1  
LDR{<c>}{<q>} <Rt>, <label> // Preferred syntax  
LDR{<c>}{<q>} <Rt>, [PC, #<+/-><imm>] // Alternative syntax
```

Decode for this encoding

```
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');  
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The SP can be used. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- <label> For encoding A1 and T2: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are Multiples of four in the range 0 to 1020.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when `U = 0`
+ when `U = 1`
- <imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
For encoding T2: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,4];
    if t == 15 then
        if address<1:0> == '00' then
            LoadWritePC(data);
        else
            UNPREDICTABLE;
    else
        R[t] = data;
```

F5.1.70 LDR (register)

Load Register (register) calculates an address from a base register value and an offset register value, loads a word from memory, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses, see [Memory accesses](#) on page F2-2401.

The T32 form of LDR (register) does not support register writeback.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	7	6	5	4	3	0
!=1111				0	1	1	P	U	0	W	1	Rn	Rt	imm5	type	0	Rm			
cond																				

Offset variant

Applies when $P == 1$ && $W == 0$.

LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]

Post-indexed variant

Applies when $P == 0$ && $W == 0$.

LDR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}]

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback$ && $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

15	14	13	12	11	10	9	8	6	5	3	2	0
0	1	0	1	1	0	0	Rm	Rn	Rt			

T1 variant

LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

T2

T2 variant

LDR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
 LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

Decode for this encoding

```
if Rn == '1111' then SEE LDR (literal);
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This branch is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
 For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
 For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC.     offset_addr = (R[n] + offset);
    address = offset_addr;
    data = MemU[address,4];
    if t == 15 then
      if address<1:0> == '00' then
        LoadWritePC(data);
      else
        UNPREDICTABLE;
    else
      R[t] = data;
```

F5.1.71 LDRB (immediate)

Load Register Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

Offset variant

Applies when P == 1 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRB{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE LDRB (literal);
if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRB{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm5, 32);
 index = TRUE; add = TRUE; wback = FALSE;

T2

T2 variant

LDRB{<c>}.W <Rt>, [<Rn> {, #<+><imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
 LDRB{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

if Rt == '1111' then SEE PLD;
 if Rn == '1111' then SEE LDRB (literal);
 t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
 index = TRUE; add = TRUE; wback = FALSE;
 // ARMv8-A removes UNPREDICTABLE for R13

T3

Offset variant

Applies when Rt != 1111 && P == 1 && U == 0 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

LDRB{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRB{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>!]

Decode for all variants of this encoding

if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE PLD, PLDW (immediate);
 if Rn == '1111' then SEE LDRB (literal);
 if P == '1' && U == '1' && W == '0' then SEE LDRBT;

 index = (P == '1'); add = (U == '1'); wback = (W == '1');
 if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
 // ARMv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRB (literal) . For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 5-bit unsigned immediate byte offset, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field. For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    R[t] = ZeroExtend(MemU[address,1], 32);
    if wback then R[n] = offset_addr;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    R[t] = ZeroExtend(MemU[address,1], 32);
    if wback then R[n] = offset_addr;
  
```

F5.1.72 LDRB (literal)

Load Register Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ W == 1)$.

LDRB{<c>}{<q>} <Rt>, <label> // Normal form
 LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: wback = FALSE;.
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRB \(immediate\)](#). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 on page K1-5447](#).

T1

T1 variant

LDRB{<c>}{<q>} <Rt>, <label> // Preferred syntax
 LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax

Decode for this encoding

```
if Rt == '1111' then SEE PLD;
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <label> The label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when `U = 0`
 - + when `U = 1`
- <imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = ZeroExtend(MemU[address,1], 32);
```

F5.1.73 LDRB (register)

Load Register Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

Offset variant

Applies when P == 1 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]

Post-indexed variant

Applies when P == 0 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}]

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

T2

index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
 For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see [Shifts applied to a register on page F2-2399](#).
- <imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    R[t] = ZeroExtend(MemU[address,1],32);
    if wback then R[n] = offset_addr;
```

F5.1.74 LDRBT

Load Register Byte Unprivileged loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2401](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11				0
!=1111				0	1	0	0	U	1	1	1	Rn	Rt	imm12				
cond																		

A1 variant

LDRBT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/-><imm>}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 on page K1-5447](#).
- The instruction uses immediate offset addressing with the base register as PC, without writeback.

If $n == t$ && $n != 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

A2

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11		7	6	5	4	3		0
!=1111				0	1	1	0	U	1	1	1	Rn	Rt	imm5	type	0	Rm					
cond																						

A2 variant

LDRBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm); postindex = TRUE; add = (U == '1');
register_form = TRUE; (shift_t, shift_n) = DecodeImmShift(type, imm5);
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == t$ && $n != 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRBT{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

```
if Rn == '1111' then SEE LDRB (literal);
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.
 For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- +/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
- + when U = 1

- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see [Shifts applied to a register on page F2-2399](#).
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
  if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
  offset_addr = if add then (R[n] + offset) else (R[n] - offset);
  address = if postindex then R[n] else offset_addr;
  R[t] = ZeroExtend(MemU_unpriv[address,1],32);
  if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as LDRB (immediate).

F5.1.75 LDRD (immediate)

Load Register Dual (immediate) calculates an address from a base register value and an immediate offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses](#) on page F2-2401.

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE LDRD (literal);
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ (n == t \ || \ n == t2)$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If $P == '0' \ \&\& \ W == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

If $Rt<0> == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

- The instruction executes with the additional decode: $t<0> = '0'$.
- The instruction executes with the additional decode: $t2 = t$.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when $Rt == '1111'$.

T1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 1$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '0' then SEE "Related encodings";
if Rn == '1111' then SEE LDRD (literal);
t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
  
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ (n == t \ || \ n == t2)$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If $t == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

T1 variant

Applies when !(P == 0 && W == 0).

LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form
 LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #<+/-><imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '0' then SEE "Related encodings";  
t = UInt(Rt); t2 = UInt(Rt2);  
imm32 = ZeroExtend(imm8:'00', 32); add = (U == '1');  
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13  
if W == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $t == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

If $W == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes without writeback.
- The instruction uses post-indexed addressing when $P == '0'$ and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 on page K1-5447](#).

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: [Load/store dual](#), [load/store exclusive](#), [table branch](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.
For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
- <Rt2> For encoding A1: is the second general-purpose register to be transferred. This register must be <R(t+1)>.
For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
- <label> For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the $A1\text{ign}(PC, 4)$ value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, imm32 is equal to the offset and $\text{add} == \text{TRUE}$, encoded as $U == 1$. If the offset is negative, imm32 is equal to minus the offset and $\text{add} == \text{FALSE}$, encoded as $U == 0$.
For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the $A1\text{ign}(PC, 4)$ value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, imm32 is equal to the offset and $\text{add} == \text{TRUE}$, encoded as $U == 1$. If the offset is negative, imm32 is equal to minus the offset and $\text{add} == \text{FALSE}$, encoded as $U == 0$.

- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- <imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
- For encoding T1: is the optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];
```

F5.1.77 LDRD (register)

Load Register Dual (register) calculates an address from a base register value and a register offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2401.

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]!

Decode for all variants of this encoding

```

if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if t2 == 15 || m == 15 || m == t || m == t2 then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ (n == t \ || \ n == t2)$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If $P == '0' \ \&\& \ W == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as an LDRD with one of offset, post-indexed, or pre-indexed addressing.

If $m == t \ || \ m == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

- The instruction loads register Rm with an UNKNOWN value.

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .

    R[t] = MemA[address,4];
    R[t2] = MemA[address+4,4];

  if wback then R[n] = offset_addr;
  
```

F5.1.78 LDREX

Load Register Exclusive calculates an address from a base register value and an immediate offset, loads a word from memory, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see [Synchronization and semaphores on page E2-2345](#). For information about memory accesses see [Memory accesses on page F2-2401](#).

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <imm> For encoding A1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can only be 0 or omitted.

For encoding T1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    AArch32.SetExclusiveMonitors(address,4);
    R[t] = MemA[address,4];
```

F5.1.79 LDREXB

Load Register Exclusive Byte derives an address from a base register value, loads a byte from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see [Synchronization and semaphores on page E2-2345](#). For information about memory accesses see [Memory accesses on page F2-2401](#).

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address,2);
    R[t] = ZeroExtend(MemA[address,2], 32);
```

F5.1.82 LDRH (immediate)

Load Register Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0				
!=1111				0	0	0	P	U	1	W	1	!=1111				Rt		imm4H		1	0	1	1	imm4L	
cond											Rn														

Offset variant

Applies when $P == 1$ && $W == 0$.

LDRH{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0$ && $W == 0$.

LDRH{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

LDRH{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE LDRH (literal);
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback$ && $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRH (literal) . For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2. For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
    if wback then R[n] = offset_addr;
    R[t] = ZeroExtend(data, 32);
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
```

```
data = MemU[address,2];  
if wback then R[n] = offset_addr;  
R[t] = ZeroExtend(data, 32);
```

F5.1.83 LDRH (literal)

Load Register Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses](#) on page F2-2401.

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ W == 1)$.

LDRH{<c>}{<q>} <Rt>, <label> // Normal form
 LDRH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt); imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: wback = FALSE;.
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRH \(immediate\)](#). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15](#) on page K1-5447.

T1

T1 variant

LDRH{<c>}{<q>} <Rt>, <label> // Preferred syntax
 LDRH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax

Decode for this encoding

```
if Rt == '1111' then SEE PLD (literal);
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <label> For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when `U = 0`
 - + when `U = 1`
- <imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
- For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = ZeroExtend(data, 32);
```

F5.1.84 LDRH (register)

Load Register Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
 For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
```

```
offset_addr = if add then (R[n] + offset) else (R[n] - offset);  
address = if index then offset_addr else R[n];  
data = MemU[address,2];  
if wback then R[n] = offset_addr;  
R[t] = ZeroExtend(data, 32);
```

F5.1.85 LDRHT

Load Register Halfword Unprivileged loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2401](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

LDRHT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/->{<imm>}}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 on page K1-5447](#).
- The instruction is treated as if $\text{bit}[24] == '1'$ and $\text{bit}[21] == '0'$. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If $n == t$ && $n != 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <label> For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when `U = 0`
 - + when `U = 1`
- <imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
- For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = SignExtend(MemU[address,1], 32);
```

F5.1.88 LDRSB (register)

Load Register Signed Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see [Memory accesses on page F2-2401](#).

R[t] = SignExtend(MemU[address,1], 32);  
if wback then R[n] = offset_addr;
```

F5.1.89 LDRSBT

Load Register Signed Byte Unprivileged loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2401](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

if t == 15 || (wback && n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

```

if Rn == '1111' then SEE LDRSH (literal);
if Rt == '1111' then SEE "Related instructions";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = TRUE; add = TRUE; wback = FALSE;
// ARMv8-A removes UNPREDICTABLE for R13
    
```

T2

Offset variant

Applies when Rt != 1111 && P == 1 && U == 0 && W == 0.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when P == 0 && W == 1.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when P == 1 && W == 1.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```

if Rn == '1111' then SEE LDRSH (literal);
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE "Related instructions";
if P == '1' && U == '1' && W == '0' then SEE LDRSHT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related instructions: [Load/Store single on page F3-2475](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRSH (literal) .
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU(address,2);
    if wback then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);
```

F5.1.91 LDRSH (literal)

Load Register Signed Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ W == 1)$.

LDRSH{<c>}{<q>} <Rt>, <label> // Normal form
 LDRSH{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRSHT;
t = UInt(Rt); imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: wback = FALSE;.
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRSH \(immediate\)](#). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 on page K1-5447](#).

T1

T1 variant

LDRSH{<c>}{<q>} <Rt>, <label> // Preferred syntax
 LDRSH{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative syntax

Decode for this encoding

```
if Rt == '1111' then SEE "Related instructions";
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related instructions: [Load literal on page F3-2479](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <label> For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when `U = 0`
 - + when `U = 1`
- <imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
- For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = SignExtend(data, 32);
```

F5.1.92 LDRSH (register)

Load Register Signed Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

Offset variant

Applies when P == 1 && W == 0.

LDRSH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]

Post-indexed variant

Applies when P == 0 && W == 0.

LDRSH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRSH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE LDRSHT;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRTYPE_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRSH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

T2

T2 variant

LDRSH{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
 LDRSH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

Decode for this encoding

```
if Rn == '1111' then SEE LDRSH (literal);
if Rt == '1111' then SEE "Related instructions";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

Related instructions: [Load/Store \(register offset\)](#) on page F3-2475.

Assembler symbols

- <c> See [Standard assembler syntax fields](#) on page F2-2396.
- <q> See [Standard assembler syntax fields](#) on page F2-2396.
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
 For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
    if wback then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);
```

F5.1.93 LDRSHT

Load Register Signed Halfword Unprivileged loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2401](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.
 For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-2399 .
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv[address,4];
    if postindex then R[n] = offset_addr;
    R[t] = data;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as LDR (immediate).

F5.1.95 LSL (immediate)

Logical Shift Left (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

F5.1.103 MCR

Move to System register from general-purpose register or execute a system instruction. This instruction copies the value of a general-purpose register to a System register, or executes a system instruction.

The System register and system instruction descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-2303](#) and [General behavior of System registers on page G4-4137](#).

In an implementation that includes EL2, MCR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-3878](#).

Because of the range of possible traps to Hyp mode, the MCR pseudocode does not show these possible traps.

A1

A1 variant

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 then UNPREDICTABLE;
```

T1

T1 variant

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:
- p14 when coproc<0> = 0
 - p15 when coproc<0> = 1
- <opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <CRn> Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.
- <CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.
- <opc2> Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.

The possible values of {<coproc>, <opc1>, <CRn>, <CRm>, <opc2>} encode the entire System register and System instruction encoding space. Not all of this space is allocated, and the System register and system instruction descriptions identify the allocated encodings.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    AArch32.SysRegWrite(cp, ThisInstr(), R[t]);
```

F5.1.104 MCRR

Move to System register from two general-purpose registers. This instruction copies the values of two general-purpose registers to a System register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-2303](#) and [General behavior of System registers on page G4-4137](#).

In an implementation that includes EL2, MCRR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCRR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-3878](#).

Because of the range of possible traps to Hyp mode, the MCRR pseudocode does not show these possible traps.

A1

A1 variant

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 then UNPREDICTABLE;
```

T1

T1 variant

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:
- p14 when coproc<0> = 0
 - p15 when coproc<0> = 1
- <opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.
- <Rt> Is the first general-purpose register that is transferred into, encoded in the "Rt" field.
- <Rt2> Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.
- <CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of {<coproc>, <opc1>, <CRm>} encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify the allocated encodings.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected System register, while <Rt> transfers bits[31:0].

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    value = R[t2]:R[t];
    AArch32.SysRegWrite64(cp, ThisInstr(), value);
```

F5.1.105 MLA, MLAS

Multiply Accumulate multiplies two register values, and adds a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

In an A32 instruction, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

31	28 27 26 25 24 23 22 21 20 19	16 15	12 11	8 7 6 5 4 3	0		
!=1111	0 0 0 0	0 0 1 S	Rd	Ra	Rm	1 0 0 1	Rn
cond							

Flag setting variant

Applies when S == 1.

MLAS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Not flag setting variant

Applies when S == 0.

MLA{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra); setflags = (S == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

T1

15 14 13 12 11 10 9 8 7 6 5 4 3	0 15	12 11	8 7 6 5 4 3	0			
1 1 1 1 1 0 1 1 0	0 0 0	Rn	!=1111	Rd	0 0	0 0	Rm
Ra							

T1 variant

MLA{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Decode for this encoding

```
if Ra == '1111' then SEE MUL;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra); setflags = FALSE;
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

- <Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Ra> Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
addend = SInt(R[a]); // addend = UInt(R[a]) produces the same final results
result = operand1 * operand2 + addend;
R[d] = result<31:0>;
if setflags then
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result<31:0>);
    // PSTATE.C, PSTATE.V unchanged
```

F5.1.106 MLS

Multiply and Subtract multiplies two register values, and subtracts the product from a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

A1

A1 variant

MLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

T1

T1 variant

MLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Ra> Is the third general-purpose source register holding the minuend, encoded in the "Ra" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
addend = SInt(R[a]); // addend = UInt(R[a]) produces the same final results
result = addend - operand1 * operand2;
R[d] = result<31:0>;
```

F5.1.107 MOV, MOVS (immediate)

Move (immediate) writes an immediate value to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MOV variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
 - The PE checks SPSR_<current_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-3819](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

MOV variant

Applies when S == 0.

MOV{<c>}{<q>} <Rd>, #<const>

MOVS variant

Applies when S == 1.

MOVS{<c>}{<q>} <Rd>, #<const>

Decode for all variants of this encoding

d = UInt(Rd); setflags = (S == '1'); (imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);

A2

A2 variant

MOV{<c>}{<q>} <Rd>, #<imm16> // <imm16> can not be represented in A1

MOVW{<c>}{<q>} <Rd>, #<imm16> // <imm16> can be represented in A1

Decode for this encoding

d = UInt(Rd); setflags = FALSE; imm32 = ZeroExtend(imm4:imm12, 32);
 if d == 15 then UNPREDICTABLE;

T1

15	14	13	12	11	10	8	7			0
0	0	1	0	0	Rd	imm8				

T1 variant

MOV<c>{<q>} <Rd>, #<imm8> // Inside IT block
 MOVS{<q>} <Rd>, #<imm8> // Outside IT block

Decode for this encoding

d = UInt(Rd); setflags = !InITBlock(); imm32 = ZeroExtend(imm8, 32); carry = PSTATE.C;

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7			0
1	1	1	1	0	i	0	0	0	1	0	S	1	1	1	1	0	imm3	Rd	imm8					

MOV variant

Applies when S == 0.

MOV<c>.W <Rd>, #<const> // Inside IT block, and <Rd>, <const> can be represented in T1
 MOV{<c>}{<q>} <Rd>, #<const>

MOVS variant

Applies when S == 1.

MOVS.W <Rd>, #<const> // Outside IT block, and <Rd>, <const> can be represented in T1
 MOVS{<c>}{<q>} <Rd>, #<const>

Decode for all variants of this encoding

d = UInt(Rd); setflags = (S == '1'); (imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
 if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

T3

15	14	13	12	11	10	9	8	7	6	5	4	3		0	15	14	12	11	8	7			0
1	1	1	1	0	i	1	0	0	1	0	0	imm4	0	imm3	Rd	imm8							

T3 variant

MOV{<c>}{<q>} <Rd>, #<imm16> // <imm16> cannot be represented in T1 or T2
 MOVW{<c>}{<q>} <Rd>, #<imm16> // <imm16> can be represented in T1 or T2

Decode for this encoding

d = UInt(Rd); setflags = FALSE; imm32 = ZeroExtend(imm4:i:imm3:imm8, 32);
 if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used:
- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
 - For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
- For encoding A2, T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.
- <imm8> Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
- <imm16> For encoding A2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.
- For encoding T3: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.
- For encoding T2: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = imm32;
    if d == 15 then           // Can only occur for encoding A1
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

F5.1.108 MOV, MOVS (register)

Move (register) copies a value from a register to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The MOV variant of the instruction is a branch. In the T32 instruction set (encoding T1) this is a simple branch, and in the A32 instruction set it is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-3819](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is used by the aliases [ASRS \(immediate\)](#), [ASR \(immediate\)](#), [LSLS \(immediate\)](#), [LSL \(immediate\)](#), [LSRS \(immediate\)](#), [LSR \(immediate\)](#), [RORS \(immediate\)](#), [ROR \(immediate\)](#), [RRXS](#), and [RRX](#). See [Alias conditions on page F5-2806](#) for details of when each alias is preferred.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	7	6	5	4	3	0
I=1111				0	0	0	1	1	0	1	S	(0)(0)(0)(0)	Rd	imm5	type	0	Rm					
cond																						

MOV, rotate right with extend variant

Applies when `S == 0` && `imm5 == 00000` && `type == 11`.

`MOV{<c>}{<q>} <Rd>, <Rm>, RRX`

MOV, shift or rotate by value variant

Applies when `S == 0` && `!(imm5 == 00000 && type == 11)`.

`MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}`

MOVS, rotate right with extend variant

Applies when `S == 1` && `imm5 == 00000` && `type == 11`.

`MOVS{<c>}{<q>} <Rd>, <Rm>, RRX`

MOVS, shift or rotate by value variant

Applies when `S == 1` && `!(imm5 == 00000 && type == 11)`.

`MOVS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
d = UInt(Rd); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1

15	14	13	12	11	10	9	8	7	6	3	2	0
0	1	0	0	0	1	1	0	D	Rm	Rd		

T1 variant

MOV{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

```
d = UInt(D:Rd); m = UInt(Rm); setflags = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, 0);
if d == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

T2

15	14	13	12	11	10	6	5	3	2	0	
0	0	0	!=11	imm5			Rm	Rd			

op

T2 variant

MOV<c>{<q>} <Rd>, <Rm> {, <shift> #<amount>} // Inside IT block
 MOV{<q>} <Rd>, <Rm> {, <shift> #<amount>} // Outside IT block

Decode for this encoding

```
d = UInt(Rd); m = UInt(Rm); setflags = TRUE;
(shift_t, shift_n) = DecodeImmShift(op, imm5);
if op == '00' && imm5 == '00000' && InITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If op == '00' && imm5 == '00000' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passed its condition code check.
- The instruction executes as a NOP, as if it failed its condition code check.
- The instruction executes as MOV Rd, Rm.

T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	1	0	0	0	1	0	S	1	1	1	1	(0)	imm3	Rd	imm2	type	Rm				

MOV, rotate right with extend variant

Applies when S == 0 && imm3 == 000 && imm2 == 00 && type == 11.

MOV{<c>}{<q>} <Rd>, <Rm>, RRX

MOV, shift or rotate by value variant

Applies when S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11).

MOV{<c>}.W <Rd>, <Rm> {, LSL #0} // <Rd>, <Rm> can be represented in T1
 MOV<c>.W <Rd>, <Rm> {, <shift> #<amount>} // Inside IT block, and <Rd>, <Rm>, <shift>, <amount> can be represented in T2
 MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}

MOVS, rotate right with extend variant

Applies when S == 1 && imm3 == 000 && imm2 == 00 && type == 11.

MOVS{<c>}{<q>} <Rd>, <Rm>, RRX

MOVS, shift or rotate by value variant

Applies when S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11).

MOVS.W <Rd>, <Rm> {, <shift> #<amount>} // Outside IT block, and <Rd>, <Rm>, <shift>, <amount> can be represented in T1 or T2
 MOVS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Alias conditions

Alias	of variant	is preferred when
ASRS (immediate)	T3 (MOVS, shift or rotate by value), A1 (MOVS, shift or rotate by value)	S == '1' && type == '10'

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used:

- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#). ARM deprecates use of the instruction if <Rn> is the PC.
- For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of the instruction if <Rn> is not the LR, or if the optional shift or RRX argument is specified.

For encoding T1: is the general-purpose destination register, encoded in the "D:Rd" field. If the PC is used:

- The instruction causes a branch to the address moved to the PC. This is a simple branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- The instruction must either be outside an IT block or the last instruction of an IT block.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used. ARM deprecates use of the instruction if <Rd> is the PC.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

<shift> For encoding A1 and T3: is the type of shift to be applied to the source register, encoded in the "type" field. It can have the following values:

LSL when type = 00
LSR when type = 01
ASR when type = 10

ROR when type = 11

For encoding T2: is the type of shift to be applied to the source register, encoded in the "op" field.
It can have the following values:

LSL when op = 00

LSR when op = 01

ASR when op = 10

<amount> For encoding A1 and T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = shifted;
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

F5.1.109 MOV, MOVS (register-shifted register)

Move (register-shifted register) copies a register-shifted register value to the destination register. It can optionally update the condition flags based on the value.

This instruction is used by the aliases [ASRS \(register\)](#), [ASR \(register\)](#), [LSLS \(register\)](#), [LSL \(register\)](#), [LSRS \(register\)](#), [LSR \(register\)](#), [RORS \(register\)](#), and [ROR \(register\)](#). See *Alias conditions* on page F5-2811 for details of when each alias is preferred.

A1

Flag setting variant

Applies when S == 1.

MOV{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>

Not flag setting variant

Applies when S == 0.

MOV{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

T1

Arithmetic shift right variant

Applies when op == 0100.

MOV<c>{<q>} <Rdm>, <Rdm>, ASR <Rs> // Inside IT block
 MOV{<q>} <Rdm>, <Rdm>, ASR <Rs> // Outside IT block

Logical shift left variant

Applies when op == 0010.

MOV<c>{<q>} <Rdm>, <Rdm>, LSL <Rs> // Inside IT block
 MOV{<q>} <Rdm>, <Rdm>, LSL <Rs> // Outside IT block

Logical shift right variant

Applies when op == 0011.

MOV<c>{<q>} <Rdm>, <Rdm>, LSR <Rs> // Inside IT block
 MOV{<q>} <Rdm>, <Rdm>, LSR <Rs> // Outside IT block

Rotate right variant

Applies when op == 0111.

```
MOV<c>{<q>} <Rdm>, <Rdm>, ROR <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, ROR <Rs> // Outside IT block
```

Decode for all variants of this encoding

```
if !(op IN {'0010', '0011', '0100', '0111'}) then SEE "Related encodings";
d = UInt(Rdm); m = UInt(Rdm); s = UInt(Rs);
setflags = !InITBlock(); shift_t = DecodeRegShift(op<2>:op<0>);
```

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	0	type	S	Rm	1	1	1	1	Rd	0	0	0	0	Rs				

Flag setting variant

Applies when S == 1.

```
MOVS.W <Rd>, <Rm>, <type> <Rs> // Outside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
MOVS{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when S == 0.

```
MOV<c>.W <Rd>, <Rm>, <type> <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
MOV{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

Related encodings: In encoding T1, for an op field value that is not described above, see [Data-processing \(two low registers\)](#) on page F3-2428.

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Alias conditions

Alias	of variant	is preferred when
ASRS (register)	A1 (flag setting)	S == '1' && type == '10'
ASRS (register)	T1 (arithmetic shift right)	op == '0100' && !InITBlock()
ASRS (register)	T2 (flag setting)	type == '10' && S == '1'
ASR (register)	A1 (not flag setting)	S == '0' && type == '10'
ASR (register)	T1 (arithmetic shift right)	op == '0100' && InITBlock()
ASR (register)	T2 (not flag setting)	type == '10' && S == '0'
LSLS (register)	A1 (flag setting)	S == '1' && type == '00'
LSLS (register)	T1 (logical shift left)	op == '0010' && !InITBlock()
LSLS (register)	T2 (flag setting)	type == '00' && S == '1'
LSL (register)	A1 (not flag setting)	S == '0' && type == '00'
LSL (register)	T1 (logical shift left)	op == '0010' && InITBlock()
LSL (register)	T2 (not flag setting)	type == '00' && S == '0'
LSRS (register)	A1 (flag setting)	S == '1' && type == '01'
LSRS (register)	T1 (logical shift right)	op == '0011' && !InITBlock()
LSRS (register)	T2 (flag setting)	type == '01' && S == '1'
LSR (register)	A1 (not flag setting)	S == '0' && type == '01'
LSR (register)	T1 (logical shift right)	op == '0011' && InITBlock()
LSR (register)	T2 (not flag setting)	type == '01' && S == '0'

RORS (register)	T1 (rotate right)	op == '0111' && !InITBlock()
RORS (register)	T2 (flag setting)	type == '11' && S == '1'
ROR (register)	A1 (not flag setting)	S == '0' && type == '11'
ROR (register)	T1 (rotate right)	op == '0111' && InITBlock()
ROR (register)	T2 (not flag setting)	type == '11' && S == '0'

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F2-2396.
- <q> See *Standard assembler syntax fields* on page F2-2396.
- <Rdm> Is the general-purpose source register and the destination register, encoded in the "Rdm" field.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> Is the general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<Rs> Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (result, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

F5.1.110 MOV_T

Move Top writes an immediate value to the top halfword of the destination register. It does not affect the contents of the bottom halfword.

A1

A1 variant

MOV_T{<c>}{<q>} <Rd>, #<imm16>

Decode for this encoding

d = UInt(Rd); imm16 = imm4:imm12;
 if d == 15 then UNPREDICTABLE;

T1

T1 variant

MOV_T{<c>}{<q>} <Rd>, #<imm16>

Decode for this encoding

d = UInt(Rd); imm16 = imm4:i:imm3:imm8;
 if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <imm16> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.
 For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    R[d]<31:16> = imm16;
    // R[d]<15:0> unchanged
```

F5.1.111 MRC

Move to general-purpose register from System register. This instruction copies the value of a System register to a general-purpose register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-2303](#) and [General behavior of System registers on page G4-4137](#).

In an implementation that includes EL2, MRC accesses to system control registers can be trapped to Hyp mode, meaning that an attempt to execute an MRC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-3878](#).

Because of the range of possible traps to Hyp mode, the MRC pseudocode does not show these possible traps.

A1

A1 variant

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

Decode for this encoding

t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;

T1

T1 variant

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

Decode for this encoding

t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
 // ARMv8-A removes UNPREDICTABLE for R13

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:

- p14 when coproc<0> = 0
- p15 when coproc<0> = 1

- <opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.
- <Rt> Is the general-purpose register to be transferred or APSR_nzcv (encoded as 0b1111), encoded in the "Rt" field. If APSR_nzcv is used, bits [31:28] of the transferred value are written to the [PSTATE](#) condition flags.
- <CRn> Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.
- <CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.
- <opc2> Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.

The possible values of {<coproc>, <opc1>, <CRn>, <CRm>, <opc2>} encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify allocated encodings.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    bits(32) value = AArch32.SysRegRead(cp, ThisInstr());
    if t != 15 then
        R[t] = value;
    elseif AArch32.SysRegReadCanWriteAPSR(cp, ThisInstr()) then
        PSTATE.<N,Z,C,V> = value<31:28>;
        // value<27:0> are not used.
    else
        PSTATE.<N,Z,C,V> = bits(4) UNKNOWN;
```

F5.1.112 MRRC

Move to two general-purpose registers from System register. This instruction copies the value of a System register to two general-purpose registers.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-2303](#) and [General behavior of System registers on page G4-4137](#).

In an implementation that includes EL2, MRRC accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MRRC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-3878](#).

Because of the range of possible traps to Hyp mode, the MRRC pseudocode does not show these possible traps.

A1

A1 variant

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The value in the destination registers is UNKNOWN.

T1

T1 variant

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If $t == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The value in the destination registers is UNKNOWN.

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:

p14 when coproc<0> = 0

p15 when coproc<0> = 1

<opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.

<Rt> Is the first general-purpose register that is transferred into, encoded in the "Rt" field.

<Rt2> Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.

<CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of {<coproc>, <opc1>, <CRm>} encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify allocated encodings.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected System register, while <Rt> transfers bits[31:0].

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    value = AArch32.SysRegRead64(cp, ThisInstr());
    R[t] = value<31:0>;
    R[t2] = value<63:32>;
```

F5.1.113 MRS

Move Special register to general-purpose register moves the value of the *The Application Program Status Register, APSR* on page E1-2289, *CPSR*, or *SPSR*_{<current_mode>} into a general-purpose register.

ARM recommends the APSR form when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see *The Application Program Status Register, APSR* on page E1-2289.

An MRS that accesses the *SPSR* is UNPREDICTABLE if executed in User mode or System mode.

An MRS that is executed in User mode and accesses the *CPSR* returns an UNKNOWN value for the *CPSR*.{E, A, I, F, M} fields.

T1 variant

MRS{<c>}{<q>} <Rd>, <spec_reg>

Decode for this encoding

```
d = UInt(Rd); read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2396.

<q> See *Standard assembler syntax fields* on page F2-2396.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<spec_reg> Is the special register to be accessed, encoded in the "R" field. It can have the following values:

CPSR|APSR when R = 0

SPSR when R = 1

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
if read_spsr then
    if PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;
    else
        R[d] = SPSR[];
else
    // CPSR has same bit assignments as SPSR, but with the IT, J, SS, IL, and T bits masked out.
    bits(32) mask = '11111000 00001111 00000011 11011111';
    psr_val = GetPSRFromPSTATE() AND mask;
    if PSTATE.EL == EL0 then
        // If accessed from User mode return UNKNOWN values for E, A, I, F bits, bits<9:6>,
        // and for the M field, bits<4:0>
        psr_val<9:6> = bits(4) UNKNOWN;
        psr_val<4:0> = bits(5) UNKNOWN;
    R[d] = psr_val;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User, M32_System} && read_spsr, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

F5.1.114 MRS (Banked register)

Move to Register from Banked or Special register moves the value from the Banked general-purpose register or [SPSR](#) of the specified mode, or the value of [ELR_hyp](#) on page G1-3788, to a general-purpose register.

MRS (Banked register) is UNPREDICTABLE if executed in User mode.

When EL3 is using AArch64, an MRS (Banked register) instruction executed in a Secure EL1 mode is trapped to EL3 if it would access [SPSR_mon](#), [SP_mon](#) or [LR_mon](#).

The effect of using an MRS (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see [Usage restrictions on the Banked register transfer instructions](#) on page F5-3215.

end if

```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

F5.1.115 MSR (Banked register)

Move to Banked or Special register from general-purpose register moves the value of a general-purpose register to the Banked general-purpose register or *SPSR* of the specified mode, or to *ELR_hyp* on page G1-3788.

MSR (Banked register) is UNPREDICTABLE if executed in User mode.

When EL3 is using AArch64, an MSR (Banked register) instruction executed in a Secure EL1 mode is trapped to EL3 if it would access *SPSR_mon*, *SP_mon* or *LR_mon*.

The effect of using an MSR (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see *Usage restrictions on the Banked register transfer instructions* on page F5-3215.

                when '1110x' // Access Monitor registers
                    if !ELUsingAArch32(EL3) then AArch64.MonitorModeTrap();
                    m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                    Rmode[m,M32_Monitor] = R[n];
                when '11110' // Access ELR_hyp register
                    ELR_hyp = R[n];
                when '11111' // Access SP_hyp register
                    Rmode[13,M32_Hyp] = R[n];
            end case
        end if
    end if
end if
  
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as a NOP.

- CPSR_<fields>.
- SPSR_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

- c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.
- x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.
- s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.
- f mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of nzcvcq, g, or nzcvcqg. These map to the following CPSR_<fields> values:

- APSR_nzcvcq is the same as CPSR_f (mask == '1000').
- APSR_g is the same as CPSR_s (mask == '0100').
- APSR_nzcvcqg is the same as CPSR_fs (mask == '1100').

ARM recommends the APSR_<bits> forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see [The Application Program Status Register, APSR](#) on page E1-2289.

<imm> Is an immediate value. See [Modified immediate constants in A32 instructions](#) on page F2-2411 for the range of values.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(imm32, mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(imm32, mask);
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User,M32_System} && write_spsr, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

F5.1.117 MSR (register)

Move general-purpose register to Special register moves selected bits of a general-purpose register to the *The Application Program Status Register, APSR* on page E1-2289, CPSR or SPSR_<current_mode>.

Because of the Do-Not-Modify nature of its reserved bits, a read-modify-write sequence is normally required when the MSR instruction is being used at Application level and its destination is not APSR_nzcvq (CPSR_f).

If an MSR (register) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-3793.

An MSR (register) executed in User mode:

- Is UNPREDICTABLE if it attempts to update the SPSR.
- Otherwise, does not update any CPSR field that is accessible only at EL1 or higher.

An MSR (register) executed in System mode is UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. ARM deprecates using this to change its value.

Decode for this encoding

```
n = UInt(Rn); write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If mask == '0000', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<spec_reg> Is one of:

- APSR_<bits>.
- CPSR_<fields>.
- SPSR_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

- c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.
- x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.
- s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.
- f mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of nzcqv, g, or nzcvqg. These map to the following CPSR_<fields> values:

- APSR_nzcqv is the same as CPSR_f (mask == '1000').
- APSR_g is the same as CPSR_s (mask == '0100').
- APSR_nzcvqg is the same as CPSR_fs (mask == '1100').

ARM recommends the APSR_<bits> forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see [The Application Program Status Register, APSR on page E1-2289](#).

<Rn> Is the general-purpose source register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(R[n], mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(R[n], mask);
```

CONSTRAINED UNPREDICTABLE behavior

If write_spsr && PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

F5.1.118 MUL, MULS

Multiply multiplies two register values. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

Optionally, it can update the condition flags based on the result. In the T32 instruction set, this option is limited to only a few forms of the instruction. Use of this option adversely affects performance on many implementations.

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rdm> Is the second general-purpose source register holding the multiplier and the destination register, encoded in the "Rdm" field.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field. If omitted, <Rd> is used.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
result = operand1 * operand2;
R[d] = result<31:0>;
if setFlags then
  PSTATE.N = result<31>;
  PSTATE.Z = IsZeroBit(result<31:0>);
  // PSTATE.C, PSTATE.V unchanged
```

F5.1.119 MVN, MVNS (immediate)

Bitwise NOT (immediate) writes the bitwise inverse of an immediate value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-3819](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

MVN variant

Applies when `S == 0`.

`MVN{<c>}{<q>} <Rd>, #<const>`

MVNS variant

Applies when `S == 1`.

`MVNS{<c>}{<q>} <Rd>, #<const>`

Decode for all variants of this encoding

```
d = UInt(Rd); setFlags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

MVN variant

Applies when `S == 0`.

`MVN{<c>}{<q>} <Rd>, #<const>`

MVNS variant

Applies when `S == 1`.

`MVNS{<c>}{<q>} <Rd>, #<const>`

Decode for all variants of this encoding

```
d = UInt(Rd); setflags = (S == '1');  
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);  
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the MVN variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the MVNS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.
For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations();  
  result = NOT(imm32);  
  if d == 15 then // Can only occur for A32 encoding  
    if setflags then  
      ALUExceptionReturn(result);  
    else  
      ALUWritePC(result);  
  else  
    R[d] = result;  
    if setflags then  
      PSTATE.N = result<31>;  
      PSTATE.Z = IsZeroBit(result);  
      PSTATE.C = carry;  
      // PSTATE.V unchanged
```

F5.1.120 MVN, MVNS (register)

Bitwise NOT (register) writes the bitwise inverse of a register value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

<Rs>	Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
```

```
result = NOT(shifted);  
R[d] = result;  
if setflags then  
    PSTATE.N = result<31>;  
    PSTATE.Z = IsZeroBit(result);  
    PSTATE.C = carry;  
    // PSTATE.V unchanged
```

F5.1.122 NOP

No Operation does nothing. This instruction can be used for instruction alignment purposes.

———— **Note** —————

The timing effects of including a NOP instruction in a program are not guaranteed. It can increase execution time, leave it unchanged, or even reduce it. Therefore, NOP instructions are not suitable for timing loops.

(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

- <shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
- LSL when type = 00
 - LSR when type = 01
 - ASR when type = 10
 - ROR when type = 11
- <amount> Is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

F5.1.125 ORR, ORRS (immediate)

Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

ORR variant

Applies when `S == 0`.

ORR{<c>}{<q>} {<Rd>}, <Rn>, #<const>

ORRS variant

Applies when `S == 1`.

ORRS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

`d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');`
`(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);`

T1

ORR variant

Applies when `S == 0`.

ORR{<c>}{<q>} {<Rd>}, <Rn>, #<const>

ORRS variant

Applies when `S == 1`.

ORRS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
if Rn == '1111' then SEE MOV (immediate);
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.

For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  result = R[n] OR imm32;
  if d == 15 then // Can only occur for A32 encoding
    if setflags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);
  else
    R[d] = result;
    if setflags then
      PSTATE.N = result<31>;
      PSTATE.Z = IsZeroBit(result);
      PSTATE.C = carry;
      // PSTATE.V unchanged
```

F5.1.126 ORR, ORRS (register)

Bitwise OR (register) performs a bitwise (inclusive) OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	7	6	5	4	3	0
!=1111		0	0	0	1	1	0	0	S	Rn	Rd	imm5	type	0	Rm					
cond																				

ORR, rotate right with extend variant

Applies when `S == 0` && `imm5 == 00000` && `type == 11`.

`ORR{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

ORR, shift or rotate by value variant

Applies when `S == 0` && `!(imm5 == 00000 && type == 11)`.

`ORR{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

ORRS, rotate right with extend variant

Applies when `S == 1` && `imm5 == 00000` && `type == 11`.

`ORRS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

ORRS, shift or rotate by value variant

Applies when `S == 1` && `!(imm5 == 00000 && type == 11)`.

`ORRS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	1	1	0	0	Rm	Rdn		

T1 variant

ORR<c>{<q>} {<Rdn>}, <Rdn>, <Rm> // Inside IT block
 ORRS{<q>} {<Rdn>}, <Rdn>, <Rm> // Outside IT block

Decode for this encoding

d = UInt(Rdn); n = UInt(Rdn); m = UInt(Rm); setflags = !InITBlock();
 (shift_t, shift_n) = (SRTYPE_LSL, 0);

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	3	0

Rn

ORR, rotate right with extend variant

Applies when S == 0 && imm3 == 000 && imm2 == 00 && type == 11.

ORR{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

ORR, shift or rotate by value variant

Applies when S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11).

ORR<c>.W {<Rd>}, <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 ORR{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

ORRS, rotate right with extend variant

Applies when S == 1 && imm3 == 000 && imm2 == 00 && type == 11.

ORRS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

ORRS, shift or rotate by value variant

Applies when S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11).

ORRS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 ORRS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

if Rn == '1111' then SEE "Related encodings";
 d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
 (shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
 if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: [Data-processing \(shifted register\)](#) on page F3-2460

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none">For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285.For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: LSL when type = 00 LSR when type = 01 ASR when type = 10 ROR when type = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if ORRS <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORRS <Rd>, <Rn> had been written.
- Inside an IT block, if ORR<c> <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

```
        ALUwritePC(result);  
else  
    R[d] = result;  
    if setflags then  
        PSTATE.N = result<31>;  
        PSTATE.Z = IsZeroBit(result);  
        PSTATE.C = carry;  
        // PSTATE.V unchanged
```

F5.1.127 ORR, ORRS (register-shifted register)

Bitwise OR (register-shifted register) performs a bitwise (inclusive) OR of a register value and a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0

PKHTB variant

Applies when `tb == 1`.

PKHTB{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ASR #<imm>} // `tbform == TRUE`

Decode for all variants of this encoding

```
if S == '1' || T == '1' then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); tbform = (tb == '1');
(shift_t, shift_n) = DecodeImmShift(tb:'0', imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<imm>	For encoding A1: the shift to apply to the value read from <Rm>, encoded in imm5. Is one of: omitted No shift, encoded as 0b00000. 1-31 Left shift by specified number of bits, encoded as a binary number.

For encoding A1: the shift to apply to the value read from <Rm>, encoded in imm5. Is one of:
omitted Instruction is a pseudo-instruction and is assembled as though PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn> had been written.
1-32 Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as 0b00000. Other shift amounts are encoded as binary numbers.

———— Note —————

An assembler can permit <imm> = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

For encoding T1: the shift to apply to the value read from <Rm>, encoded in imm3:imm2. For PKHBT, it is one of:

omitted	No shift, encoded as 0b00000.
1-31	Left shift by specified number of bits, encoded as a binary number.

For PKHTB, it is one of:

omitted	Instruction is a pseudo-instruction and is assembled as though PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn> had been written.
1-32	Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as 0b00000. Other shift amounts are encoded as binary numbers.

———— Note —————

An assembler can permit <imm> = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand2 = Shift(R[m], shift_t, shift_n, PSTATE.C); // PSTATE.C ignored
R[d]<15:0> = if tbform then operand2<15:0> else R[n]<15:0>;
R[d]<31:16> = if tbform then R[n]<31:16>     else operand2<31:16>;
```

T2

Preload read variant

Applies when W == 0.

PLD{<c>}{<q>} [<Rn> {, #-<imm>}]

Preload write variant

Applies when W == 1.

PLDW{<c>}{<q>} [<Rn> {, #-<imm>}]

Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn); imm32 = ZeroExtend(imm8, 32); add = FALSE; is_pldw = (W == '1');
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F2-2396](#). Must be AL or omitted.
For encoding T1 and T2: see [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see [PLD \(literal\)](#).
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (R[n] + imm32) else (R[n] - imm32);
    if is_pldw then
        Hint_PreloadDataForWrite(address);
    else
        Hint_PreloadData(address);
```

- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- <imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.
- For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
Hint_PreloadData(address);
```

F5.1.131 PLD, PLDW (register)

Preload Data (register) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-2311](#).

1	1	1	1	1	0	0	1	U	0	0	1	1	1	1	1	1	1	1	1	imm12						

T3 variant

PLI{<c>}{<q>} <label> // Preferred syntax
PLI{<c>}{<q>} [PC, #<+/-><imm>] // Alternative syntax

Decode for this encoding

n = 15; imm32 = ZeroExtend(imm12, 32); add = (U == '1');

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F2-2396](#). Must be AL or omitted.
For encoding T1, T2 and T3: see [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <label> The label of the instruction that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. The offset must be in the range `-4095` to `4095`. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.
For encoding T3: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For the literal forms of the instruction, encoding T3 is used, or Rn is encoded as `0b1111` in encoding A1, to indicate that the PC is the base register.

The alternative literal syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2359](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = if n == 15 then Align(PC,4) else R[n];
    address = if add then (base + imm32) else (base - imm32);
    Hint_PreloadInstr(address);
```

F5.1.133 PLI (register)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-2311](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
1	1	1	1	0	1	1	0	U	1	0	1	Rn	(1)	(1)	(1)	(1)	imm5	type	0	Rm				

Rotate right with extend variant

Applies when imm5 == 00000 && type == 11.

PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]

Shift or rotate by value variant

Applies when !(imm5 == 00000 && type == 11).

PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm); add = (U == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	0	0	1	0	0	0	1	!=1111		1	1	1	1	0	0	0	0	0	0	imm2	Rm		

Rn

T1 variant

PLI{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]

Decode for this encoding

```
if Rn == '1111' then SEE PLI (immediate, literal);
n = UInt(Rn); m = UInt(Rm); add = TRUE;
(shift_t, shift_n) = (SRTType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> For encoding A1: see [Standard assembler syntax fields on page F2-2396](#). <c> must be AL or omitted.

	For encoding T1: see <i>Standard assembler syntax fields</i> on page F2-2396.
<q>	See <i>Standard assembler syntax fields</i> on page F2-2396.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the index register, encoded in the "type" field. It can have the following values: LSL when type = 00 LSR when type = 01 ASR when type = 10 ROR when type = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
address = if add then (R[n] + offset) else (R[n] - offset);
Hint_PreloadInstr(address);
```

F5.1.134 POP

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).

T1

15	14	13	12	11	10	9	8	7											0
1	0	1	1	1	1	0	P	register_list											

T1 variant

```
POP{<c>}{<q>} <registers> // Preferred syntax
LDM{<c>}{<q>} SP!, <registers> // Alternate syntax
```

Decode for this encoding

```
registers = P:'0000000':register_list; UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `BitCount(registers) < 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the PC. If the PC is in the list, the "P" field is set to 1, otherwise this field defaults to 0. If the PC is in the list, the instruction must be either outside any IT block, or the last instruction in an IT block.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = if UnalignedAllowed then MemU[address,4] else MemA[address,4];
            address = address + 4;
    if registers<15> == '1' then
        if UnalignedAllowed then
            if address<1:0> == '00' then
                LoadWritePC(MemU[address,4]);
            else
                UNPREDICTABLE;
        else
            LoadWritePC(MemA[address,4]);
    if registers<13> == '0' then SP = SP + 4*BitCount(registers);
    if registers<13> == '1' then SP = bits(32) UNKNOWN;
```

lists of general-purpose registers and the PC on page F2-2402. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0. The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285.* If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

Operation for all encodings

The description of [LDM](#), [LDMIA](#), [LDMFD](#) gives the operational pseudocode for this instruction.

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC](#) on page E1-2285.

Operation for all encodings

The description of [LDR \(immediate\)](#) gives the operational pseudocode for this instruction.

F5.1.137 PUSH

Push Multiple Registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data.

The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

T1

15	14	13	12	11	10	9	8	7											0
1	0	1	1	0	1	0	M	register_list											

T1 variant

```
PUSH{<c>}{<q>} <registers> // Preferred syntax
STMDB{<c>}{<q>} SP!, <registers> // Alternate syntax
```

Decode for this encoding

```
registers = '0':M:'000000':register_list; UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `BitCount(registers) < 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the LR. If the LR is in the list, the "M" field is set to 1, otherwise this field defaults to 0.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            if i == 13 && i != LowestSetBit(registers) then // Only possible for encoding A1
                MemA[address,4] = bits(32) UNKNOWN;
```

```
    else
        if UnalignedAllowed then
            MemU[address,4] = R[i];
        else
            MemA[address,4] = R[i];
        address = address + 4;
if registers<15> == '1' then // Only possible for encoding A1 or A2
    if UnalignedAllowed then
        MemU[address,4] = PCStoreValue();
    else
        MemA[address,4] = PCStoreValue();
SP = SP - 4*BitCount(registers);
```

F5.1.138 PUSH (multiple registers)

Push multiple registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data

This instruction is an alias of the [STMDB](#), [STMFd](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [STMDB](#), [STMFd](#).
- The description of [STMDB](#), [STMFd](#) gives the operational pseudocode for this instruction.

A1

A1 variant

PUSH{<c>}{<q>} <registers>

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when `BitCount(register_list) > 1`.

T1

T1 variant

PUSH{<c>}{<q>} <registers>

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when `BitCount(register_list) > 1`.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<registers> For encoding A1: is a list of two or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#). The SP and PC can be in the list. However:

- ARM deprecates the use of instructions that include the PC in the list.
- If the SP is in the list, and it is not the lowest-numbered register in the list, the instruction stores an UNKNOWN value for the SP.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#). The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

The description of [STMDB](#), [STMFd](#) gives the operational pseudocode for this instruction.

F5.1.140 QADD

Saturating Add adds two register values, saturates the result to the 32-bit signed integer range -2^{31} to $(2^{31} - 1)$, and writes the result to the destination register. If saturation occurs, it sets `PSTATE.Q` to 1.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

QDADD{<c>}{<q>} {<Rd>}, <Rm>, <Rn>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> Is the first general-purpose source register, encoded in the "Rm" field.
- <Rn> Is the second general-purpose source register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (doubled, sat1) = SignedSatQ(2 * SInt(R[n]), 32);
```

```
(R[d], sat2) = SignedSatQ(SInt(R[m]) + SInt(doubled), 32);  
if sat1 || sat2 then  
    PSTATE.Q = '1';
```

F5.1.145 QDSUB

Saturating Double and Subtract subtracts a doubled register value from another register value, and writes the result to the destination register. Both the doubling and the subtraction have their results saturated to the 32-bit signed integer range $-2^{31} \leq x \leq 2^{31} - 1$. If saturation occurs in either operation, it sets `PSTATE.Q` to 1.

- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T2: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    bits(32) result;
    result<31:8> = SignExtend(R[m]<7:0>, 24);
    result<7:0> = R[m]<15:8>;
    R[d] = result;
```

F5.1.154 RFE, RFEDA, RFEDB, RFEIA, RFEIB

Return From Exception loads two consecutive memory locations using an address in a base register:

- The word loaded from the lower address is treated as an instruction address. The PE branches to it.
- The word loaded from the higher address is used to restore [PSTATE](#). This word must be in the format of an SPSR.

An address adjusted by the size of the data loaded can optionally be written back to the base register.

The PE checks the value of the word loaded from the higher address for an illegal return event. See [Illegal return events from AArch32 state on page G1-3819](#).

RFE is UNDEFINED in Hyp mode and CONSTRAINED UNPREDICTABLE in User mode.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Decode for this encoding

```
n = UInt(Rn); wback = (W == '1'); increment = TRUE; wordhigher = FALSE;
if n == 15 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- IA For encoding A1: is an optional suffix to indicate the Increment After variant.
 For encoding T2: is an optional suffix for the Increment After form.
- <c> For encoding A1: see [Standard assembler syntax fields on page F2-2396](#). <c> must be AL or omitted.
 For encoding T1 and T2: see [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

RFEFA, RFEFA, RFEFD, and RFEED are pseudo-instructions for RFEDA, RFEDB, RFEIA, and RFEIB respectively, referring to their use for popping data from Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elseif PSTATE.EL == EL0 then
        UNPREDICTABLE; // UNDEFINED or NOP
    else
        address = if increment then R[n] else R[n]-8;
        if wordhigher then address = address+4;
        new_pc_value = MemA[address,4];
        spsr = MemA[address+4,4];
        if wback then R[n] = if increment then R[n]+8 else R[n]-8;
        AArch32.ExceptionReturn(new_pc_value, spsr);
```

CONSTRAINED UNPREDICTABLE behavior

If `PSTATE.EL == EL0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

F5.1.155 ROR (immediate)

Rotate Right (immediate) provides the value of the contents of a register rotated by a constant value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

A1

        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.162 RSB, RSBS (register)

Reverse Subtract (register) subtracts a register value from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

31	28 27 26 25 24 23 22 21 20 19	16 15	12 11	7 6 5 4 3	0
!=1111	0 0 0 0 0 1 1 S	Rn	Rd	imm5	type 0 Rm
cond					

RSB, rotate right with extend variant

Applies when `S == 0` && `imm5 == 00000` && `type == 11`.

`RSB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

RSB, shift or rotate by value variant

Applies when `S == 0` && `!(imm5 == 00000 && type == 11)`.

`RSB{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

RSBS, rotate right with extend variant

Applies when `S == 1` && `imm5 == 00000` && `type == 11`.

`RSBS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

RSBS, shift or rotate by value variant

Applies when `S == 1` && `!(imm5 == 00000 && type == 11)`.

`RSBS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	1	1	0	S	Rn	(0)	imm3	Rd	imm2	type	Rm						

RSB, rotate right with extend variant

Applies when $S == 0$ && $imm3 == 000$ && $imm2 == 00$ && $type == 11$.

RSB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

RSB, shift or rotate by value variant

Applies when $S == 0$ && $!(imm3 == 000 \&\& imm2 == 00 \&\& type == 11)$.

RSB{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

RSBS, rotate right with extend variant

Applies when $S == 1$ && $imm3 == 000$ && $imm2 == 00$ && $type == 11$.

RSBS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

RSBS, shift or rotate by value variant

Applies when $S == 1$ && $!(imm3 == 000 \&\& imm2 == 00 \&\& type == 11)$.

RSBS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setFlags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

- For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
- | | |
|-----|----------------|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |
- <amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(NOT(R[n]), shifted, '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.163 RSB, RSBS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0	0	0	0	0	1	1	S	Rn	Rd	Rs	0	type	1	Rm				
cond																						

Flag setting variant

Applies when S == 1.

RSBS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Not flag setting variant

Applies when S == 0.

RSB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
 - LSL when type = 00
 - LSR when type = 01
 - ASR when type = 10
 - ROR when type = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(NOT(R[n]), shifted, '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
```

- <Rn> Is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
- <const> An immediate value. See *Modified immediate constants in A32 instructions* on page F2-2411 for the range of values.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(NOT(R[n]), imm32, PSTATE.C);
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.165 RSC, RSCS (register)

Reverse Subtract with Carry (register) subtracts a register value and the value of NOT (Carry flag) from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	7	6	5	4	3	0
!=1111				0	0	0	0	1	1	1	S	Rn	Rd	imm5	type	0	Rm			
cond																				

RSC, rotate right with extend variant

Applies when `S == 0` && `imm5 == 00000` && `type == 11`.

`RSC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

RSC, shift or rotate by value variant

Applies when `S == 0` && `!(imm5 == 00000 && type == 11)`.

`RSC{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

RSCS, rotate right with extend variant

Applies when `S == 1` && `imm5 == 00000` && `type == 11`.

`RSCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

RSCS, shift or rotate by value variant

Applies when `S == 1` && `!(imm5 == 00000 && type == 11)`.

`RSCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setFlags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2396.

<q> See *Standard assembler syntax fields* on page F2-2396.

- <Rd> Is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:
- For the RSC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
 - For the RSCS variant, the instruction performs an exception return, that restores [PSTATE](#) from `SPSR_<current_mode>`.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
- | | |
|-----|----------------|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |
- <amount> Is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(NOT(R[n]), shifted, PSTATE.C);
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.166 RSC, RSCS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value and the value of NOT (Carry flag) from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  sum1 = SInt(R[n]<7:0>) + SInt(R[m]<7:0>);
  sum2 = SInt(R[n]<15:8>) + SInt(R[m]<15:8>);
  sum3 = SInt(R[n]<23:16>) + SInt(R[m]<23:16>);
```

```
sum4 = SInt(R[n]<31:24>) + SInt(R[m]<31:24>);  
R[d]<7:0> = sum1<7:0>;  
R[d]<15:8> = sum2<7:0>;  
R[d]<23:16> = sum3<7:0>;  
R[d]<31:24> = sum4<7:0>;  
PSTATE.GE<0> = if sum1 >= 0 then '1' else '0';  
PSTATE.GE<1> = if sum2 >= 0 then '1' else '0';  
PSTATE.GE<2> = if sum3 >= 0 then '1' else '0';  
PSTATE.GE<3> = if sum4 >= 0 then '1' else '0';
```

F5.1.169 SASX

Signed Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer addition and one 16-bit subtraction, and writes the results to the destination register. It sets `PSTATE.GE` according to the results.

A1

A1 variant

SASX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

SASX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
diff = SInt(R[n]<15:0>) - SInt(R[m]<31:16>);
sum = SInt(R[n]<31:16>) + SInt(R[m]<15:0>);
```

```
R[d]<15:0> = diff<15:0>;  
R[d]<31:16> = sum<15:0>;  
PSTATE.GE<1:0> = if diff >= 0 then '11' else '00';  
PSTATE.GE<3:2> = if sum >= 0 then '11' else '00';
```

SBCS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);  
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.

For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    (result, nzcV) = AddWithCarry(R[n], NOT(imm32), PSTATE.C);  
    if d == 15 then // Can only occur for A32 encoding  
        if setflags then  
            ALUExceptionReturn(result);  
        else  
            ALUWritePC(result);  
    else  
        R[d] = result;  
        if setflags then  
            PSTATE.<N,Z,C,V> = nzcV;
```

F5.1.171 SBC, SBCS (register)

Subtract with Carry (register) subtracts an optionally-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SBCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The SBC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The SBCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	7	6	5	4	3	0
!=1111				0	0	0	0	1	1	0	S	Rn	Rd	imm5	type	0	Rm			
cond																				

SBC, rotate right with extend variant

Applies when `S == 0` && `imm5 == 00000` && `type == 11`.

`SBC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

SBC, shift or rotate by value variant

Applies when `S == 0` && `!(imm5 == 00000 && type == 11)`.

`SBC{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

SBCS, rotate right with extend variant

Applies when `S == 1` && `imm5 == 00000` && `type == 11`.

`SBCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX`

SBCS, shift or rotate by value variant

Applies when `S == 1` && `!(imm5 == 00000 && type == 11)`.

`SBCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	0	1	1	0	Rm	Rdn		

T1 variant

SBC<c>{<q>} {<Rdn>}, <Rdn>, <Rm> // Inside IT block
 SBCS{<q>} {<Rdn>}, <Rdn>, <Rm> // Outside IT block

Decode for this encoding

```
d = UInt(Rdn); n = UInt(Rdn); m = UInt(Rm); setFlags = !InITBlock();
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	0	1	1	S	Rn	(0)	imm3	Rd	imm2	type	Rm						

SBC, rotate right with extend variant

Applies when S == 0 && imm3 == 000 && imm2 == 00 && type == 11.

SBC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

SBC, shift or rotate by value variant

Applies when S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11).

SBC<c>.W {<Rd>}, <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 SBC{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

SBCS, rotate right with extend variant

Applies when S == 1 && imm3 == 000 && imm2 == 00 && type == 11.

SBCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

SBCS, shift or rotate by value variant

Applies when S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11).

SBCS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 SBCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setFlags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .								
<q>	See Standard assembler syntax fields on page F2-2396 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285. For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when type = 00</td> </tr> <tr> <td>LSR</td> <td>when type = 01</td> </tr> <tr> <td>ASR</td> <td>when type = 10</td> </tr> <tr> <td>ROR</td> <td>when type = 11</td> </tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.								

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzc;
  
```

F5.1.172 SBC, SBCS (register-shifted register)

Subtract with Carry (register-shifted register) subtracts a register-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!=1111				0 0 0 0				1 1 0 S				Rn		Rd		Rs		0 type		1 Rm	
cond																					

Flag setting variant

Applies when S == 1.

SBCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Not flag setting variant

Applies when S == 0.

SBC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .								
<q>	See Standard assembler syntax fields on page F2-2396 .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when type = 00</td> </tr> <tr> <td>LSR</td> <td>when type = 01</td> </tr> <tr> <td>ASR</td> <td>when type = 10</td> </tr> <tr> <td>ROR</td> <td>when type = 11</td> </tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzc;
```

F5.1.173 SBFX

Signed Bit Field Extract extracts any number of adjacent bits at any position from a register, sign-extends them to 32 bits, and writes the result to the destination register.

A1

31	28	27	26	25	24	23	22	21	20	16	15	12	11	7	6	5	4	3	0

cond																					

A1 variant

SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn);
 lsbbit = UInt(lsb); widthminus1 = UInt(widthm1);
 if d == 15 || n == 15 then UNPREDICTABLE;

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	0
1	1	1	1	0	(0)	1	1	0	1	0	0	Rn		0	imm3		Rd		imm2		(0)	widthm1	

T1 variant

SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn);
 lsbbit = UInt(imm3:imm2); widthminus1 = UInt(widthm1);
 if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<lsb>	For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field. For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.
<width>	Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "widthm1" field as <width>-1.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsb + widthminus1;
    if msbit <= 31 then
        R[d] = SignExtend(R[n]<msbit:lsb>, 32);
    else
        UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $msbit > 31$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

F5.1.174 SDIV

Signed Divide divides a 32-bit signed integer register value by a 32-bit signed integer register value, and writes the result to the destination register. The condition flags are not affected.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0	1	1	1	0	0	0	1	Rd	(1)	(1)	(1)	(1)	Rm	0	0	0	1	Rn
cond											Ra											

A1 variant

SDIV{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
 if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as described, with no change to its behavior and no additional side-effects.
- The instruction executes as described, and the register specified by Ra becomes UNKNOWN.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	1	1	0	0	1	Rn	(1)	(1)	(1)	(1)	Rd	1	1	1	1	Rm	
													Ra										

T1 variant

SDIV{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
 if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as described, with no change to its behavior and no additional side-effects.
- The instruction executes as described, and the register specified by Ra becomes UNKNOWN.

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register holding the dividend, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the divisor, encoded in the "Rm" field.

Overflow

If the signed integer division $0x80000000 / 0xFFFFFFFF$ is performed, the pseudocode produces the intermediate integer result $+2^{31}$, that overflows the 32-bit signed integer range. No indication of this overflow case is produced, and the 32-bit result written to <Rd> must be the bottom 32 bits of the binary representation of $+2^{31}$. So the result of the division is $0x80000000$.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if SInt(R[m]) == 0 then
        result = 0;
    else
        result = RoundTowardsZero(Real(SInt(R[n])) / Real(SInt(R[m])));
    R[d] = result<31:0>;
```

F5.1.175 SEL

Select Bytes selects each byte of its result from either its first operand or its second operand, according to the values of the `PSTATE.GE` flags.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

```

F5.1.185 SMC

Secure Monitor Call causes a Secure Monitor Call exception. For more information see [Secure Monitor Call \(SMC\) exception on page G1-3838](#).

SMC is available only for software executing at EL1 or higher. It is UNDEFINED in User mode.

If the values of `HCR.TSC` and `SCR.SCD` are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception that is taken to EL3. When EL3 is using AArch32 this exception is taken to Monitor mode. When EL3 is using AArch64, it is the `SCR_EL3.SMD` bit, rather than the `SCR.SCD` bit, that can change the effect of executing an SMC instruction.

If the value of `HCR.TSC` is 1, execution of an SMC instruction in a Non-secure EL1 mode generates an exception that is taken to EL2, regardless of the value of `SCR.SCD`. When EL2 is using AArch32, this is a Hyp Trap exception that is taken to Hyp mode. For more information see [Traps to Hyp mode of Non-secure EL1 execution of SMC instructions on page G1-3885](#).

If the value of `HCR.TSC` is 0 and the value of `SCR.SCD` is 1, the SMC instruction is:

- UNDEFINED in Non-secure state.
- CONSTRAINED UNPREDICTABLE if executed in Secure state at EL1 or higher.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	0

cond																											

A1 variant

SMC{<c>}{<q>} {#}<imm4>

Decode for this encoding

// imm4 is for assembly/disassembly only and is ignored by hardware

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	1	1	1	1	1	1	imm4	1	0	0	0	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)

T1 variant

SMC{<c>}{<q>} {#}<imm4>

Decode for this encoding

// imm4 is for assembly/disassembly only and is ignored by hardware
 if `InITBlock()` && `!LastInITBlock()` then UNPREDICTABLE;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <imm4> Is a 4-bit unsigned immediate value, in the range 0 to 15, encoded in the "imm4" field. This is ignored by the PE. The Secure Monitor Call exception handler (Secure Monitor code) can use this value to determine what service is being requested, but ARM does not recommend this.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    if !HaveEL(EL3) || PSTATE.EL == EL0 then
        UNDEFINED;

    AArch32.CheckForSMCTrap();

    if !ELUsingAArch32(EL3) then
        if SCR_EL3.SMD == '1' then
            // SMC disabled.
            UNDEFINED;
        else
            if SCR.SCD == '1' then
                // SMC disabled
                if IsSecure() then
                    UNPREDICTABLE;
                UNDEFINED;

            if !ELUsingAArch32(EL3) then
                AArch64.CallSecureMonitor(Zeros(16));
            else
                AArch32.TakeSMCException();
```

CONSTRAINED UNPREDICTABLE behavior

If SCR.SCD == '1' && IsSecure(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

F5.1.186 SMLABB, SMLABT, SMLATB, SMLATT

Signed Multiply Accumulate (halfwords) performs a signed multiply accumulate operation. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is added to a 32-bit accumulate value and the result is written to the destination register.

If overflow occurs during the addition of the accumulate value, the instruction sets `PSTATE.Q` to 1. It is not possible for overflow to occur during the multiplication.

A1

SMLABB variant

Applies when `M == 0 && N == 0`.

SMLABB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

SMLABT variant

Applies when N == 1 && M == 0.

SMLATB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

SMLATT variant

Applies when N == 1 && M == 1.

SMLATT{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Decode for all variants of this encoding

```
if Ra == '1111' then SEE SMULBB, SMULBT, SMULTB, SMULTT;  
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);  
n_high = (N == '1'); m_high = (M == '1');  
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand in the bottom or top half (selected by <x>), encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.
<Ra>	Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations();  
  operand1 = if n_high then R[n]<31:16> else R[n]<15:0>;  
  operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;  
  result = SInt(operand1) * SInt(operand2) + SInt(R[a]);  
  R[d] = result<31:0>;  
  if result != SInt(result<31:0>) then // Signed overflow  
    PSTATE.Q = '1';
```

F5.1.187 SMLAD, SMLADX

Signed Multiply Accumulate Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 32-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets `PSTATE.Q` to 1 if the accumulate operation overflows. Overflow cannot occur during the multiplications.

A1

SMLAD variant

Applies when `M == 0`.

`SMLAD{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

SMLADX variant

Applies when `M == 1`.

`SMLADX{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

Decode for all variants of this encoding

```
if Ra == '1111' then SEE SMUAD;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

SMLAD variant

Applies when `M == 0`.

`SMLAD{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

SMLADX variant

Applies when `M == 1`.

`SMLADX{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

Decode for all variants of this encoding

```
if Ra == '1111' then SEE SMUAD;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

    operand2 = if m_swap then ROR(R[m],16) else R[m];
    product1 = SInt(R[n]<15:0>) * SInt(operand2<15:0>);
    product2 = SInt(R[n]<31:16>) * SInt(operand2<31:16>);
    result = product1 + product2 + SInt(R[a]);
    R[d] = result<31:0>;
    if result != SInt(result<31:0>) then // Signed overflow
        PSTATE.Q = '1';
```

F5.1.188 SMLAL, SMLALS

Signed Multiply Accumulate Long multiplies two signed 32-bit values to produce a 64-bit value, and accumulates this with a 64-bit value.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

31	28 27	26	25	24 23	22	21	20 19	16 15	12 11	8	7	6	5	4	3	0
!=1111	0	0	0	0	1	1	1	S	RdHi	RdLo	Rm	1	0	0	1	Rn
cond																

Flag setting variant

Applies when S == 1.

SMLALS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Not flag setting variant

Applies when S == 0.

SMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for all variants of this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If dHi == dLo, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

T1

15	14	13	12 11	10	9	8	7	6	5	4	3	0	15	12 11	8	7	6	5	4	3	0

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<RdLo>	Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
<RdHi>	Is the general-purpose source register holding the upper 32 bits of the addend, and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = SInt(R[n]) * SInt(R[m]) + SInt(R[dHi]:R[dLo]);
    R[dHi] = result<63:32>;
    R[dLo] = result<31:0>;
    if setflags then
        PSTATE.N = result<63>;
        PSTATE.Z = IsZeroBit(result<63:0>);
        // PSTATE.C, PSTATE.V unchanged
```

F5.1.189 SMLALBB, SMLALBT, SMLALTB, SMLALTT

Signed Multiply Accumulate Long (halfwords) multiplies two signed 16-bit values to produce a 32-bit value, and accumulates this with a 64-bit value. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is sign-extended and accumulated with a 64-bit accumulate value.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo 2^{64} .

A1

SMLALBB variant

Applies when $M == 0 \ \&\& \ N == 0$.

SMLALBB{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

SMLALBT variant

Applies when $M == 1 \ \&\& \ N == 0$.

SMLALBT{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

SMLALTB variant

Applies when $M == 0 \ \&\& \ N == 1$.

SMLALTB{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

SMLALTT variant

Applies when $M == 1 \ \&\& \ N == 1$.

SMLALTT{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for all variants of this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm);
n_high = (N == '1'); m_high = (M == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $dHi == dLo$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

T1

  result = product1 + product2 + SInt(R[dHi]:R[dLo]);  
  R[dHi] = result<63:32>;  
  R[dLo] = result<31:0>;
```

F5.1.191 SMLAWB, SMLAWT

Signed Multiply Accumulate (word by halfword) performs a signed multiply accumulate operation. The multiply acts on a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are added to a 32-bit accumulate value and the result is written to the destination register. The bottom 16 bits of the 48-bit product are ignored.

If overflow occurs during the addition of the accumulate value, the instruction sets `PSTATE.Q` to 1. No overflow can occur during the multiplication.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = (SInt(R[a]) << 32) + SInt(R[n]) * SInt(R[m]);
    if round then result = result + 0x80000000;
    R[d] = result<63:32>;
```

F5.1.195 SMMLS, SMMLSR

Signed Most Significant Word Multiply Subtract multiplies two signed 32-bit values, subtracts the result from a 32-bit accumulate value that is shifted left by 32 bits, and extracts the most significant 32 bits of the result of that subtraction.

Optionally, the instruction can specify that the result of the instruction is rounded instead of being truncated. In this case, the constant $0x80000000$ is added to the result of the subtraction before the high word is extracted.

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = SInt(R[n]) * SInt(R[m]);
    if round then result = result + 0x80000000;
    R[d] = result<63:32>;
```

F5.1.197 SMUAD, SMUADX

Signed Dual Multiply Add performs two signed 16 x 16-bit multiplications. It adds the products together, and writes the result to the destination register.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets `PSTATE.Q` to 1 if the addition overflows. The multiplications cannot overflow.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0

- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand2 = if m_swap then ROR(R[m],16) else R[m];
product1 = SInt(R[n]<15:0>) * SInt(operand2<15:0>);
product2 = SInt(R[n]<31:16>) * SInt(operand2<31:16>);
result = product1 + product2;
R[d] = result<31:0>;
if result != SInt(result<31:0>) then // Signed overflow
    PSTATE.Q = '1';
```

F5.1.198 SMULBB, SMULBT, SMULTB, SMULTT

Signed Multiply (halfwords) multiplies two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is written to the destination register. No overflow is possible during this instruction.

A1

SMULBB variant

Applies when M == 0 && N == 0.

SMULBB{<C>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULBT variant

Applies when M == 1 && N == 0.

SMULBT{<C>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULTB variant

Applies when N == 1 && M == 0.

SMULTB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULTT variant

Applies when N == 1 && M == 1.

SMULTT{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
n_high = (N == '1'); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register holding the multiplicand in the bottom or top half (selected by <x>), encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand1 = if n_high then R[n]<31:16> else R[n]<15:0>;
operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
result = SInt(operand1) * SInt(operand2);
R[d] = result<31:0>;
// Signed overflow cannot occur
```

F5.1.199 SMULL, SMULLS

Signed Multiply Long multiplies two 32-bit signed values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

Flag setting variant

Applies when S == 1.

SMULLS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Not flag setting variant

Applies when S == 0.

SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for all variants of this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If dHi == dLo, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

T1

T1 variant

SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $dHi == dLo$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<RdLo>	Is the general-purpose destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
<RdHi>	Is the general-purpose destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = SInt(R[n]) * SInt(R[m]);
    R[dHi] = result<63:32>;
    R[dLo] = result<31:0>;
    if setflags then

result = product1 - product2;
R[d] = result<31:0>;
// Signed overflow cannot occur
```

F5.1.202 SRS, SRSDA, SRSDB, SRSIA, SRSIB

Store Return State stores the LR_<current_mode> and SPSR_<current_mode> to the stack of a specified mode. For information about memory accesses see [Memory accesses](#) on page F2-2401.

SRS is UNDEFINED in Hyp mode.

SRS is UNPREDICTABLE if it is executed in User or System mode, or if the specified mode is any of the following:

- Not implemented.
- A mode that [Table G1-2](#) on page G1-3780 does not show.
- Not accessible from the context that the SRS instruction is executed in, as follows:
 - A mode that is at a higher Exception level.
 - When executing in Non-secure state, Monitor mode.

When EL3 is using AArch64, an SRS instruction executed in a Secure EL1 mode is trapped to EL3 if the instruction specifies Monitor mode.

See [Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32](#) on page D1-1588.

Arithmetic shift right variant

Applies when `sh == 1`.

SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>

Logical shift left variant

Applies when `sh == 0`.

SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm)+1;
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm5);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	0
1	1	1	1	0	(0)	1	1	0	0	sh	0	Rn	0	imm3	Rd	imm2	(0)	sat_imm					

Arithmetic shift right variant

Applies when `sh == 1 && !(imm3 == 000 && imm2 == 00)`.

SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>

Logical shift left variant

Applies when `sh == 0`.

SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}

Decode for all variants of this encoding

```
if sh == '1' && (imm3:imm2) == '0000' then SEE SSAT16;
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm)+1;
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm3:imm2);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F2-2396.
- <q> See *Standard assembler syntax fields* on page F2-2396.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <imm> Is the bit position for saturation, in the range 1 to 32, encoded in the "sat_imm" field as <imm>-1.
- <Rn> Is the general-purpose source register, encoded in the "Rn" field.
- <amount> For encoding A1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.
For encoding A1: is the shift amount, in the range 1 to 32 encoded in the "imm5" field as <amount> modulo 32.
For encoding T1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm3:imm2" field.
For encoding T1: is the shift amount, in the range 1 to 31 encoded in the "imm3:imm2" field as <amount>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand = Shift(R[n], shift_t, shift_n, PSTATE.C); // PSTATE.C ignored
    (result, sat) = SignedSatQ(SInt(operand), saturate_to);
    R[d] = SignExtend(result, 32);
    if sat then
        PSTATE.Q = '1';
```

F5.1.204 SSAT16

Signed Saturate 16 saturates two signed 16-bit values to a selected signed range.

This instruction sets `PSTATE.Q` to 1 if the operation saturates.

PSTATE.GE<2> = if diff3 >= 0 then '1' else '0';  
PSTATE.GE<3> = if diff4 >= 0 then '1' else '0';
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	0
1	1	1	0	1	1	0	P	U	0	W	0	Rn	0	1	0	1	1	1	1	0	imm8		

Offset variant

Applies when P == 1 && W == 0.

STC{<c>}{<q>} p14, c5, [<Rn>{, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

STC{<c>}{<q>} p14, c5, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

STC{<c>}{<q>} p14, c5, [<Rn>, #<+/-><imm>]!

Unindexed variant

Applies when P == 0 && U == 1 && W == 0.

STC{<c>}{<q>} p14, c5, [<Rn>], <option>

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then UNDEFINED;
n = UInt(Rn); cp = 14;
imm32 = ZeroExtend(imm8:'00', 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes without writeback.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 on page K1-5447](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rn> For the offset or unindexed variant: is the general-purpose base register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For the offset, post-indexed or pre-indexed variant: is the general-purpose base register, encoded in the "Rn" field.

<option> Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.

- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- <imm> Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];

    // System register read from DBGDTRRXint.
    MemA[address,4] = DBGDTR_EL0[];

    if wback then R[n] = offset_addr;
```

- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- | | |
|---|--|
| 0 | If the operation updates memory. |
| 1 | If the operation fails to update memory. |

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,4) then
```

```
Mem0[address, 4] = R[t];  
R[d] = ZeroExtend('0');  
else  
R[d] = ZeroExtend('1');
```

F5.1.212 STLEXB

Store-Release Exclusive Byte stores a byte from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page B2-89.

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-2345. For information about memory accesses see [Memory accesses](#) on page F2-2401.

A1

A1 variant

STLEXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .				
<q>	See Standard assembler syntax fields on page F2-2396 .				
<Rd>	Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is: <table><tr><td>0</td><td>If the operation updates memory.</td></tr><tr><td>1</td><td>If the operation fails to update memory.</td></tr></table>	0	If the operation updates memory.	1	If the operation fails to update memory.
0	If the operation updates memory.				
1	If the operation fails to update memory.				
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.				
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.				

Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        Mem0[address, 1] = R[t]<7:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

F5.1.213 STLEXD

Store-Release Exclusive Doubleword stores a doubleword from two registers to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2345. For information about memory accesses see *Memory accesses* on page F2-2401.

A1

A1 variant

STLEXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); t2 = t+1; n = UInt(Rn);
if d == 15 || Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

If $Rt<0> == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: $Rt<0> = '0'$;
- The instruction executes with the additional decode: $t2 = t$;
- The instruction executes without any change to its behavior.

T1

T1 variant

STLEXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);  
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;  
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

<Rt2> For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be $R(t+1)$.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is `IMPLEMENTATION DEFINED` whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is `IMPLEMENTATION DEFINED` whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address, 8) then
        Mem0[address, 8] = value;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

F5.1.214 STLEXH

Store-Release Exclusive Halfword stores a halfword from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page B2-89.

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-2345. For information about memory accesses see [Memory accesses](#) on page F2-2401.

if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<13> == '1' then UNPREDICTABLE;
if registers<15> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If BitCount(registers) == 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without any change to its behavior.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored for the base register is UNKNOWN.

If registers<13> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

- The store instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

If registers<15> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

If n == 15 && wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 on page K1-5447](#).

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

IA	Is an optional suffix for the Increment After form.
<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<registers>	<p>For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.</p> <p>For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field. If the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.</p> <p>For encoding T2: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.</p>

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
```

```
        MemA[address,4] = bits(32) UNKNOWN; // Only possible for encodings T1 and A1
    else
        MemA[address,4] = R[i];
        address = address + 4;
    if registers<15> == '1' then // Only possible for encoding A1
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] + 4*BitCount(registers);
```

F5.1.217 STM (User registers)

In an EL1 mode other than System mode, Store Multiple (User registers) stores multiple User mode registers to consecutive memory locations using an address from a base register. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Store Multiple (User registers) is UNDEFINED in Hyp mode, and CONSTRAINED UNPREDICTABLE in User or System modes.

A1

A1 variant

STM{<amode>}{<c>}{<q>} <Rn>, <registers>^

Decode for this encoding

```
n = UInt(Rn); registers = register_list; increment = (U == '1'); wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<amode>	is one of:	
	DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
	ED	Empty Descending. For this instruction, a synonym for DA.
	DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
	FD	Full Descending. For this instruction, a synonym for DB.
	IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
	EA	Empty Ascending. For this instruction, a synonym for IA.
	IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
	FA	Full Ascending. For this instruction, a synonym for IB.

- <c> See [Standard assembler syntax fields](#) on page F2-2396.
- <q> See [Standard assembler syntax fields](#) on page F2-2396.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <registers> Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be stored by the STM instruction. The registers are stored with the lowest-numbered register to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC](#) on page F2-2402.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elseif PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;
    else
        length = 4*BitCount(registers);
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;
        for i = 0 to 14
            if registers<i> == '1' then // Store User mode register
                MemA[address,4] = Rmode[i, M32_User];
                address = address + 4;
            if registers<15> == '1' then
                MemA[address,4] = PCStoreValue();
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

F5.1.218 STMDA, STMED

Store Multiple Decrement After (Empty Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

For details of related system instructions see [STM \(User registers\)](#).

A1

A1 variant

STMDA{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If n == 15 && wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;
            else
                MemA[address,4] = R[i];
                address = address + 4;
    if registers<15> == '1' then
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] - 4*BitCount(registers);
```

F5.1.219 STMDB, STMFD

Store Multiple Decrement Before (Full Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the first of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

For details of related system instructions see [STM \(User registers\)](#).

This instruction is used by the alias [PUSH \(multiple registers\)](#). See [Alias conditions on page F5-3045](#) for details of when each alias is preferred.

if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<13> == '1' then UNPREDICTABLE;
if registers<15> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If $\text{wback} \ \&\& \ \text{registers}\langle n \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored for the base register is UNKNOWN.

If $\text{BitCount}(\text{registers}) == 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes as STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If $\text{registers}\langle 13 \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

If $\text{registers}\langle 15 \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Alias conditions

Alias	is preferred when
PUSH (multiple registers)	$W == '1' \ \&\& \ Rn == '1101' \ \&\& \ \text{BitCount}(\text{register_list}) > 1$

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN; // Only possible for encoding A1
            else
                MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then // Only possible for encoding A1
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] - 4*BitCount(registers);
  
```

F5.1.220 STMIB, STMFA

Store Multiple Increment Before (Full Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start just above this address, and the address of the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2402](#).

For details of related system instructions see [STM \(User registers\)](#).

A1

A1 variant

STMIB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 STMFA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Ascending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `BitCount(registers) < 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If `n == 15 && wback`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;
            else
                MemA[address,4] = R[i];
                address = address + 4;
    if registers<15> == '1' then
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] + 4*BitCount(registers);
```

T1

15	14	13	12	11	10		6	5	3	2	0
0	1	1	0	0	imm5			Rn	Rt

Rn

T3 variant

STR{<c>}.W <Rt>, [<Rn> {, #<+><imm>}] // <Rt>, <Rn>, <imm> can be represented in T1 or T2
 STR{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

if Rn == '1111' then UNDEFINED;
 t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
 index = TRUE; add = TRUE; wback = FALSE;
 if t == 15 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

T4

Offset variant

Applies when $P == 1 \ \&\& \ U == 0 \ \&\& \ W == 0$.

STR{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 1$.

STR{<c>}{<q>} <Rt>, [<Rn>, #+/-<imm>]

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

STR{<c>}{<q>} <Rt>, [<Rn>, #+/-<imm>]!

Decode for all variants of this encoding

```

if P == '1' && U == '1' && W == '0' then SEE STRT;
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback \ \&\& \ n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Alias conditions

Alias	of variant	is preferred when
PUSH (single register)	A1 (pre-indexed)	$P == '1' \ \&\& \ U == '0' \ \&\& \ W == '1' \ \&\& \ Rn == '1101' \ \&\& \ imm12 == '00000000100'$
PUSH (single register)	T4 (pre-indexed)	$Rn == '1101' \ \&\& \ U == '0' \ \&\& \ imm8 == '0000100'$

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding T1, T2, T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding T1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4. For encoding T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 and encoded in the "imm8" field as <imm>/4. For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,4] = if t == 15 then PCStoreValue() else R[t];
    if wback then R[n] = offset_addr;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,4] = R[t];
    if wback then R[n] = offset_addr;
  
```

F5.1.222 STR (register)

Store Register (register) calculates an address from a base register value and an offset register value, stores a word from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see [Memory accesses](#) on page F2-2401.

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

STR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}]

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE STRT;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback \ \&\& \ n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

1	1	1	1	1	0	0	0	0	0	0	0	0	!=1111		Rt		0	0	0	0	0	0	imm2		Rm

Rn

T2 variant

STRB{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
 STRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.
For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see [Shifts applied to a register on page F2-2399](#).
- <imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,1] = R[t]<7:0>;
    if wback then R[n] = offset_addr;
```

F5.1.225 STRBT

Store Register Byte Unprivileged stores a byte from a register to memory. For information about memory accesses see [Memory accesses on page F2-2401](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

A1 variant

STRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Rn																						

T1 variant

STRBT{<c>}{<q>} <Rt>, [<Rn> {, #+}<imm>]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-2399 .
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    MemU_unpriv[address,1] = R[t]<7:0>;
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as STRB (immediate).

F5.1.226 STRD (immediate)

Store Register Dual (immediate) calculates an address from a base register value and an immediate offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses](#) on page F2-2401.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0	0	0	P	U	1	W	0	Rn	Rt	imm4H	1	1	1	1	imm4L			
cond																						

Offset variant

Applies when $P == 1$ && $W == 0$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0$ && $W == 0$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$ || $t2 == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $wback$ && $(n == t$ || $n == t2)$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback$ && $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

If P == '0' && W == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

T1

Offset variant

Applies when P == 1 && W == 0.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '0' then SEE "Related encodings";
t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if n == 15 || t == 15 || t2 == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
    
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15 || t2 == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If `wback && (n == t || n == t2)`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If `wback && n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

    MemA[address+4,4] = R[t2];
if wback then R[n] = offset_addr;
```

F5.1.228 STREX

Store Register Exclusive calculates an address from a base register value and an immediate offset, stores a word from a register to the calculated address if the PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see [Synchronization and semaphores on page E2-2345](#). For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

A1 variant

STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, {#}<imm>}]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn); imm32 = Zeros(32); // Zero offset
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

T1

T1 variant

STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, #<imm>}]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<imm> For encoding A1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can only be 0 or omitted.

For encoding T1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    if AArch32.ExclusiveMonitorsPass(address,4) then
        MemA[address,4] = R[t];
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

F5.1.229 STREXB

Store Register Exclusive Byte derives an address from a base register value, stores a byte from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see [Synchronization and semaphores on page E2-2345](#). For information about memory accesses see [Memory accesses on page F2-2401](#).

```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	0	0	1	1	0	0	Rn	Rt	(1)	(1)	(1)	(1)	0	1	0	0	Rd			

T1 variant

STREXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .				
<q>	See Standard assembler syntax fields on page F2-2396 .				
<Rd>	Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is: <table><tr><td>0</td><td>If the operation updates memory.</td></tr><tr><td>1</td><td>If the operation fails to update memory.</td></tr></table>	0	If the operation updates memory.	1	If the operation fails to update memory.
0	If the operation updates memory.				
1	If the operation fails to update memory.				
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.				
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.				

Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        MemA[address,1] = R[t]<7:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

F5.1.230 STREXD

Store Register Exclusive Doubleword derives an address from a base register value, stores a 64-bit doubleword from two registers to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see [Synchronization and semaphores on page E2-2345](#). For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

A1 variant

STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); t2 = t+1; n = UInt(Rn);
if d == 15 || Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

If $Rt<0> == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes with the additional decode: $Rt<0> = '0'$.
- The instruction executes with the additional decode: $t2 = t$.
- The instruction operates without any change to its behavior.

T1

T1 variant

STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn);
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rd>	Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is: 0 If the operation updates memory. 1 If the operation fails to update memory. <Rd> must not be the same as <Rn>, <Rt>, or <Rt2>.
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14. For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be $R(t+1)$. For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non doubleword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is `IMPLEMENTATION DEFINED` whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is `IMPLEMENTATION DEFINED` whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address,8) then
        MemA[address,8] = value; R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

F5.1.231 STREXH

Store Register Exclusive Halfword derives an address from a base register value, stores a halfword from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see [Synchronization and semaphores on page E2-2345](#). For information about memory accesses see [Memory accesses on page F2-2401](#).

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,2) then
```

```
MemA[address,2] = R[t]<15:0>;  
R[d] = ZeroExtend('0');  
else  
R[d] = ZeroExtend('1');
```

F5.1.232 STRH (immediate)

Store Register Halfword (immediate) calculates an address from a base register value and an immediate offset, and stores a halfword from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2401.

A1

Offset variant

Applies when P == 1 && W == 0.

STRH{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 0.

STRH{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

STRH{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE STRHT;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If wback && n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

STRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!

Decode for all variants of this encoding

```
if P == '1' && U == '1' && W == '0' then SEE STRHT;
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $wback$ && $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding A1, T1, T2, T3: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when $U = 0$ + when $U = 1$
+	Specifies the offset is added to the base register.

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2.

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,2] = R[t]<15:0>;
    if wback then R[n] = offset_addr;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,2] = R[t]<15:0>;
    if wback then R[n] = offset_addr;
```

F5.1.233 STRH (register)

Store Register Halfword (register) calculates an address from a base register value and an offset register value, and stores a halfword from a register to memory. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see [Memory accesses on page F2-2401](#).

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

STRH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE STRHT;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRTType_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback \ \&\& \ n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,2] = R[t]<15:0>;
    if wback then R[n] = offset_addr;
```

F5.1.234 STRHT

Store Register Halfword Unprivileged stores a halfword from a register to memory. For information about memory accesses see [Memory accesses](#) on page F2-2401.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

T1 variant

STRHT{<c>}{<q>} <Rt>, [<Rn> {, #+}<imm>]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    MemU_unpriv[address,2] = R[t]<15:0>;
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

- The instruction executes as STRH (immediate).

F5.1.235 STRT

Store Register Unprivileged stores a word from a register to memory. For information about memory accesses see [Memory accesses on page F2-2401](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

A1 variant

STRT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/-><imm>}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

A2

A2 variant

STRT{<c>}{<q>} <Rt>, [<Rn>], {<+/-><Rm>{, <shift>}}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm); postindex = TRUE; add = (U == '1');
register_form = TRUE; (shift_t, shift_n) = DecodeImmShift(type, imm5);
if n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without writeback.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

T1 variant

STRT{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q>	See Standard assembler syntax fields on page F2-2396 .
<Rt>	For encoding A1 and A2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-2399 .
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    if t == 15 then // Only possible for encodings A1 and A2
        data = PCStoreValue();
    else
        data = R[t];
    MemU_unpriv[address,4] = data;
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as STR (immediate).

F5.1.236 SUB (immediate, from PC)

Subtract from PC subtracts an immediate value from the `Align(PC, 4)` value to form a PC-relative address, and writes the result to the destination register. ARM recommends that, where possible, software avoids using this alias

This instruction is an alias of the [ADR](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ADR](#).
- The description of [ADR](#) gives the operational pseudocode for this instruction.

A2

A2 variant

SUB{<c>}{<q>} <Rd>, PC, #<const>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is the preferred disassembly when `imm12 == '000000000000'`.

T2

T2 variant

SUB{<c>}{<q>} <Rd>, PC, #<imm12>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is the preferred disassembly when `i:imm3:imm8 == '000000000000'`.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field.

<label> For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label. If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset. If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset.

That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are any of the constants described in [Modified immediate constants in A32 instructions on page F2-2411](#).

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label. If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset. If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are 0-4095.

- `<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
- `<const>` An immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.

Operation for all encodings

The description of [ADR](#) gives the operational pseudocode for this instruction.

F5.1.237 SUB, SUBS (immediate)

Subtract (immediate) subtracts an immediate value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The SUBS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode, except for encoding T5 with <imm8> set to zero, which is the encoding for the ERET instruction, see ERET.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

SUB variant

Applies when `S == 0` && `Rn != 11x1`.

`SUB{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

SUBS variant

Applies when `S == 1` && `Rn != 1101`.

`SUBS{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

Decode for all variants of this encoding

```
if Rn == '1111' && S == '0' then SEE ADR;
if Rn == '1101' then SEE SUB (SP minus immediate);
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);
```

T1

T1 variant

`SUB{<c>}{<q>} <Rd>, <Rn>, #<imm3>` // Inside IT block
`SUBS{<q>} <Rd>, <Rn>, #<imm3>` // Outside IT block

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); setflags = !InITBlock(); imm32 = ZeroExtend(imm3, 32);

T2

15	14	13	12	11	10	8	7									0
0	0	1	1	1		Rdn										imm8

T2 variant

SUB<c>{<q>} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> can be represented in T1
 SUB<c>{<q>} {<Rdn>}, <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> cannot be represented in T1
 SUBS{<q>} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> can be represented in T1
 SUBS{<q>} {<Rdn>}, <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> cannot be represented in T1

Decode for this encoding

d = UInt(Rdn); n = UInt(Rdn); setflags = !InITBlock(); imm32 = ZeroExtend(imm8, 32);

T3

Rn

T4 variant

SUB{<c>}{<q>} {<Rd>}, <Rn>, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
 SUBW{<c>}{<q>} {<Rd>}, <Rn>, #<imm12> // <imm12> can be represented in T1, T2, or T3

Decode for this encoding

```
if Rn == '1111' then SEE ADR;
if Rn == '1101' then SEE SUB (SP minus immediate);
d = UInt(Rd); n = UInt(Rn); setflags = FALSE; imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T5

T5 variant

SUBS{<c>}{<q>} PC, LR, #<imm8>

Decode for this encoding

```
if Rn == '1110' && IsZero(imm8) then SEE ERET;
d = 15; n = UInt(Rn); setflags = TRUE; imm32 = ZeroExtend(imm8, 32);
if n != 14 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rdn> Is the general-purpose source and destination register, encoded in the "Rdn" field.
- <imm8> For encoding T2: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
 For encoding T5: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
 If <Rn> is the LR, and zero is used, see [ERET](#).
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:
 - For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
 - For the SUBS variant, the instruction performs an exception return, that restores [PSTATE](#) from `SPSR_<current_mode>`. ARM deprecates use of this instruction unless <Rn> is the LR.
- For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
- <Rn> For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see [SUB, SUBS \(SP minus immediate\)](#). If the PC is used, see [ADR](#).
 For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
 For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see [SUB, SUBS \(SP minus immediate\)](#).

- <imm3> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.
- <imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.
For encoding T3: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

In the T32 instruction set, MOV_S{<c>}{<q>} PC, LR is a pseudo-instruction for SUB_S{<c>}{<q>} PC, LR, #0.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], NOT(imm32), '1');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.238 SUB, SUBS (register)

Subtract (register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2285.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3819.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. <p>For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.</p>								
<Rn>	<p>For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. If the SP is used, see SUB, SUBS (SP minus register).</p> <p>For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.</p> <p>For encoding T2: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus register).</p>								
<Rm>	<p>For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.</p> <p>For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.</p>								
<shift>	<p>Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:</p> <table> <tr> <td>LSL</td> <td>when type = 00</td> </tr> <tr> <td>LSR</td> <td>when type = 01</td> </tr> <tr> <td>ASR</td> <td>when type = 10</td> </tr> <tr> <td>ROR</td> <td>when type = 11</td> </tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<amount>	<p>For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.</p> <p>For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.</p>								

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], NOT(shifted), '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzc;
  
```

F5.1.239 SUB, SUBS (register-shifted register)

Subtract (register-shifted register) subtracts a register-shifted register value from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!=1111				0	0	0	0	0	1	0	S	Rn	Rd	Rs	0	type	1	Rm			
cond																					

Flag setting variant

Applies when S == 1.

SUBS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Not flag setting variant

Applies when S == 0.

SUB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <type> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .								
<q>	See Standard assembler syntax fields on page F2-2396 .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when type = 00</td> </tr> <tr> <td>LSR</td> <td>when type = 01</td> </tr> <tr> <td>ASR</td> <td>when type = 10</td> </tr> <tr> <td>ROR</td> <td>when type = 11</td> </tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], NOT(shifted), '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzc;
```

F5.1.240 SUB, SUBS (SP minus immediate)

Subtract from SP (immediate) subtracts an immediate value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-3819](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

SUB variant

Applies when `S == 0`.

`SUB{<c>}{<q>}{<Rd>}, SP, #<const>`

SUBS variant

Applies when `S == 1`.

`SUBS{<c>}{<q>}{<Rd>}, SP, #<const>`

Decode for all variants of this encoding

`d = UInt(Rd); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);`

T1

T1 variant

`SUB{<c>}{<q>}{SP}, SP, #<imm7>`

Decode for this encoding

`d = 13; setflags = FALSE; imm32 = ZeroExtend(imm7:'00', 32);`

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	0
1	1	1	1	0	i	0	1	1	0	1	S	1	1	0	1	0	imm3	Rd	imm8			

SUB variant

Applies when S == 0.

SUB{<c>}.W {<Rd>}, SP, #<const> // <Rd>, <const> can be represented in T1
 SUB{<c>}{<q>} {<Rd>}, SP, #<const>

SUBS variant

Applies when S == 1 && Rd != 1111.

SUBS{<c>}{<q>} {<Rd>}, SP, #<const>

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMP (immediate);
d = UInt(Rd); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 && !setflags then UNPREDICTABLE;
```

T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	0
1	1	1	1	0	i	1	0	1	0	1	0	1	1	0	1	0	imm3	Rd	imm8			

T3 variant

SUB{<c>}{<q>} {<Rd>}, SP, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
 SUBW{<c>}{<q>} {<Rd>}, SP, #<imm12> // <imm12> can be represented in T1, T2, or T3

Decode for this encoding

```
d = UInt(Rd); setflags = FALSE; imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <imm7> Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "imm7" field as <imm7>/4.
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. If the PC is used:
 - For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).

- For the SUBS variant, the instruction performs an exception return, that restores **PSTATE** from **SPSR_<current_mode>**. ARM deprecates use of this instruction unless **<Rn>** is the LR.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.

For encoding T2: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcV) = AddWithCarry(SP, NOT(imm32), '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcV;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	1	0	1	S	1	1	0	1	(0)	imm3	Rd	imm2	type	Rm					

SUB, rotate right with extend variant

Applies when $S == 0 \ \&\& \ imm3 == 000 \ \&\& \ imm2 == 00 \ \&\& \ type == 11$.

`SUB{<c>}{<q>} {<Rd>}, SP, <Rm>, RRX`

SUB, shift or rotate by value variant

Applies when $S == 0 \ \&\& \ !(imm3 == 000 \ \&\& \ imm2 == 00 \ \&\& \ type == 11)$.

`SUB{<c>}.W {<Rd>}, SP, <Rm> // <Rd>, <Rm>` can be represented in T1 or T2
`SUB{<c>}{<q>} {<Rd>}, SP, <Rm> {, <shift> #<amount>}`

SUBS, rotate right with extend variant

Applies when $S == 1 \ \&\& \ imm3 == 000 \ \&\& \ Rd != 1111 \ \&\& \ imm2 == 00 \ \&\& \ type == 11$.

`SUBS{<c>}{<q>} {<Rd>}, SP, <Rm>, RRX`

SUBS, shift or rotate by value variant

Applies when $S == 1 \ \&\& \ !(imm3 == 000 \ \&\& \ imm2 == 00 \ \&\& \ type == 11) \ \&\& \ Rd != 1111$.

`SUBS{<c>}{<q>} {<Rd>}, SP, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMP (register);
d = UInt(Rd); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2285](#).
- For the SUBS variant, the instruction performs an exception return, that restores `PSTATE` from `SPSR_<current_mode>`.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

- <Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
- | | |
|-----|----------------|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |
- <amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcV) = AddWithCarry(SP, NOT(shifted), '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcV;
```

F5.1.242 SVC

Supervisor Call causes a Supervisor Call exception. For more information, see [Supervisor Call \(SVC\) exception on page G1-3837](#).

———— **Note** —————

SVC was previously called SWI, Software Interrupt, and this name is still found in some documentation.

Software can use this instruction as a call to an operating system to provide a service.

In the following cases, the Supervisor Call exception generated by the SVC instruction is taken to Hyp mode:

- If the SVC is executed in Hyp mode.
- If *HCR.TGE* is set to 1, and the SVC is executed in Non-secure User mode. For more information, see [Supervisor Call exception, when the value of HCR.TGE is 1 on page G1-3813](#)

In these cases, the *HSR* identifies that the exception entry was caused by a Supervisor Call exception, EC value 0x11, see [Use of the HSR on page G4-4123](#). The immediate field in the *HSR*:

- If the SVC is unconditional:
 - For the T32 instruction, is the zero-extended value of the *imm8* field.
 - For the A32 instruction, is the least-significant 16 bits the *imm24* field.
- If the SVC is conditional, is UNKNOWN.

A1

A1 variant

SVC{<c>}{<q>} {#}<imm>

Decode for this encoding

imm32 = ZeroExtend(*imm24*, 32);

T1

T1 variant

SVC{<c>}{<q>} {#}<imm>

Decode for this encoding

imm32 = ZeroExtend(*imm8*, 32);

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <imm> For encoding A1: is a 24-bit unsigned immediate, in the range 0 to 16777215, encoded in the "imm24" field. This value is for assembly and disassembly only. SVC handlers in some systems interpret imm24 in software, for example to determine the required service.
- For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. This value is for assembly and disassembly only. SVC handlers in some systems interpret imm8 in software, for example to determine the required service.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CallSupervisor(imm32<15:0>);
```

F5.1.243 SXTAB

Signed Extend and Add Byte extracts an 8-bit value from a register, sign-extends it to 32 bits, adds the result to the value in another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

A1

A1 variant

SXTAB{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ROR #<amount>}

Decode for this encoding

```
if Rn == '1111' then SEE SXTB;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

SXTAB{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ROR #<amount>}

Decode for this encoding

```
if Rn == '1111' then SEE SXTB;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <amount> Is the rotate amount, encoded in the "rotate" field. It can have the following values:
 - (omitted) when rotate = 00
 - 8 when rotate = 01

16 when rotate = 10
24 when rotate = 11

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = R[n] + SignExtend(rotated<7:0>, 32);
```

F5.1.244 SXTAB16

Signed Extend and Add Byte 16 extracts two 8-bit values from a register, sign-extends them to 16 bits each, adds the results to two 16-bit values from another register, and writes the final results to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit values.

A1

d = UInt(Rd); m = UInt(Rm); rotation = 0;

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	0	1	0	0	1	1	1	1	Rd	1	(0)	rotate	Rm							

T2 variant

SXTB{<c>}.W {<Rd>,<Rm> // <Rd>,<Rm> can be represented in T1
 SXTB{<c>}{<q>} {<Rd>,<Rm> {, ROR #<amount>}

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); rotation = UInt(rotate:'000');
 if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the general-purpose source register, encoded in the "Rm" field.
<amount>	Is the rotate amount, encoded in the "rotate" field. It can have the following values: (omitted) when rotate = 00 8 when rotate = 01 16 when rotate = 10 24 when rotate = 11

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = SignExtend(rotated<7:0>, 32);
```

F5.1.247 SXTB16

Signed Extend Byte 16 extracts two 8-bit values from a register, sign-extends them to 16 bits each, and writes the results to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit values.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0

    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = SignExtend(rotated<15:0>, 32);
```

F5.1.249 TBB, TBH

Table Branch Byte or Halfword causes a PC-relative forward branch using a table of single byte or halfword offsets. A base register provides a pointer to the table, and a second register supplies an index into the table. The branch length is twice the value returned from the table.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	0	0	1	1	0	1	Rn	(1)	(1)	(1)	(1)	(0)	(0)	(0)	(0)	0	0	0	H	Rm		

Byte variant

Applies when H == 0.

TBB{<c>}{<q>} [<Rn>, <Rm>] // Outside or last in IT block

Halfword variant

Applies when H == 1.

TBH{<c>}{<q>} [<Rn>, <Rm>, LSL #1] // Outside or last in IT block

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm); is_tbh = (H == '1');
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<Rn> Is the general-purpose base register holding the address of the table of branch lengths, encoded in the "Rn" field. The PC can be used. If it is, the table immediately follows this instruction.

<Rm> For the byte variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a single byte in the table. The offset in the table is the value of the index.

For the halfword variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a halfword in the table. The offset in the table is twice the value of the index.

Operation

```
if ConditionPassed() then
  EncodingSpecificOperations();
  if is_tbh then
    halfwords = UInt(MemU[R[n]+LSL(R[m],1), 2]);
  else
    halfwords = UInt(MemU[R[n]+R[m], 1]);
  BranchWritePC(PC + 2*halfwords);
```

F5.1.250 TEQ (immediate)

Test Equivalence (immediate) performs a bitwise exclusive OR operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

TEQ{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn);
 (imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);

T1

T1 variant

TEQ{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn);
 (imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
 if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
 For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.
 For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] EOR imm32;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

F5.1.251 TEQ (register)

Test Equivalence (register) performs a bitwise exclusive OR operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
!=1111				0	0	0	1	0	0	1	1	Rn	(0)	(0)	(0)	(0)	imm5	type	0	Rm		
cond																						

Rotate right with extend variant

Applies when imm5 == 00000 && type == 11.

TEQ{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm5 == 00000 && type == 11).

TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = DecodeImmShift(type, imm5);

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	1	0	1	0	0	1	Rn	(0)	imm3	1	1	1	1	imm2	type	Rm					

Rotate right with extend variant

Applies when imm3 == 000 && imm2 == 00 && type == 11.

TEQ{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm3 == 000 && imm2 == 00 && type == 11).

TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
 if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
LSL when type = 00
LSR when type = 01
ASR when type = 10
ROR when type = 11
- <amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

F5.1.252 TEQ (register-shifted register)

Test Equivalence (register-shifted register) performs a bitwise exclusive OR operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0	
!=1111				0	0	0	1	0	0	1	1	Rn	(0)	(0)	(0)	(0)	Rs	0	type	1	Rm			
cond																								

A1 variant

TEQ{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: LSL when type = 00 LSR when type = 01 ASR when type = 10 ROR when type = 11
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
  EncodingSpecificOperations();
  shift_n = UInt(R[s]<7:0>);
  (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
  result = R[n] EOR shifted;
  PSTATE.N = result<31>;
  PSTATE.Z = IsZeroBit(result);
  PSTATE.C = carry;
  // PSTATE.V unchanged
```

F5.1.253 TST (immediate)

Test (immediate) performs a bitwise AND operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

TST{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn);
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);

T1

T1 variant

TST{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn);
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F2-2411](#) for the range of values.
For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F2-2409](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] AND imm32;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

F5.1.254 TST (register)

Test (register) performs a bitwise AND operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0	
!=1111				0	0	0	1	0	0	0	1	Rn	(0)	(0)	(0)	(0)	imm5	type	0	Rm			
cond																							

Rotate right with extend variant

Applies when imm5 == 00000 && type == 11.

TST{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm5 == 00000 && type == 11).

TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = DecodeImmShift(type, imm5);

T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	1	0	0	0	Rm	Rn		

T1 variant

TST{<c>}{<q>} <Rn>, <Rm>

Decode for this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = (SRTYPE_LSL, 0);

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	1	0	0	0	0	1	Rn	(0)	imm3	1	1	1	1	imm2	type	Rm					

Rotate right with extend variant

Applies when imm3 == 000 && imm2 == 00 && type == 11.

TST{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm3 == 000 && imm2 == 00 && type == 11).

```
TST{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1  
TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);  
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);  
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: LSL when type = 00 LSR when type = 01 ASR when type = 10 ROR when type = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations();  
  (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);  
  result = R[n] AND shifted;  
  PSTATE.N = result<31>;  
  PSTATE.Z = IsZeroBit(result);  
  PSTATE.C = carry;  
  // PSTATE.V unchanged
```

F5.1.255 TST (register-shifted register)

Test (register-shifted register) performs a bitwise AND operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0

<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when type = 00</td> </tr> <tr> <td>LSR</td> <td>when type = 01</td> </tr> <tr> <td>ASR</td> <td>when type = 10</td> </tr> <tr> <td>ROR</td> <td>when type = 11</td> </tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

F5.1.256 UADD16

Unsigned Add 16 performs two 16-bit unsigned integer additions, and writes the results to the destination register. It sets `PSTATE.GE` according to the results of the additions.

A1

A1 variant

UADD16{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

UADD16{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the `CONSTRAINED UNPREDICTABLE` behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
diff = UInt(R[n]<15:0>) - UInt(R[m]<31:16>);
sum = UInt(R[n]<31:16>) + UInt(R[m]<15:0>);
```

```
R[d]<15:0> = diff<15:0>;  
R[d]<31:16> = sum<15:0>;  
PSTATE.GE<1:0> = if diff >= 0 then '11' else '00';  
PSTATE.GE<3:2> = if sum >= 0x10000 then '11' else '00';
```

F5.1.259 UBFX

Unsigned Bit Field Extract extracts any number of adjacent bits at any position from a register, zero-extends them to 32 bits, and writes the result to the destination register.

A1

A1 variant

UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn);
lsbit = UInt(lsb); widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

T1 variant

UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn);
lsbit = UInt(imm3:imm2); widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the general-purpose source register, encoded in the "Rn" field.
- <lsb> For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field.
For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.
- <width> Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "widthm1" field as <width>-1.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsbite + widthminus1;
    if msbit <= 31 then
        R[d] = ZeroExtend(R[n]<msbit:lsbite>, 32);
    else
        UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $msbit > 31$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F2-2396](#). <c> must be AL or omitted.
For encoding T1 and T2: see [Standard assembler syntax fields on page F2-2396](#). ARM deprecates using any <c> value other than AL.
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. The PE ignores the value of this constant.
For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. The PE ignores the value of this constant.
For encoding T2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. The PE ignores the value of this constant.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    UNDEFINED;
```

F5.1.261 UDIV

Unsigned Divide divides a 32-bit unsigned integer register value by a 32-bit unsigned integer register value, and writes the result to the destination register. The condition flags are not affected.

See [Divide instructions on page F1-2369](#) for more information about this instruction.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0	1	1	1	0	0	1	1	Rd	(1)	(1)	(1)	(1)	Rm	0	0	0	1	Rn
cond											Ra											

A1 variant

UDIV{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
 if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without any change to its behavior.
- The instruction performs a divide and the register specified by Ra becomes UNKNOWN.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	0

													Ra										

T1 variant

UDIV{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
 if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates without any change to its behavior.
- The instruction performs a divide and the register specified by Ra becomes UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F2-2396.
- <q> See *Standard assembler syntax fields* on page F2-2396.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register holding the dividend, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the divisor, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if UInt(R[m]) == 0 then
        result = 0;
    else
        result = RoundTowardsZero(Real(UInt(R[n])) / Real(UInt(R[m])));
    R[d] = result<31:0>;
```

F5.1.262 UHADD16

Unsigned Halving Add 16 performs two unsigned 16-bit integer additions, halves the results, and writes the results to the destination register.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

    R[d] = result<31:0>;
```

F5.1.279 USAT

Unsigned Saturate saturates an optionally-shifted signed value to a selected unsigned range.

This instruction sets `PSTATE.Q` to 1 if the operation saturates.

A1

31	28	27	26	25	24	23	22	21	20	16	15	12	11	7	6	5	4	3	0	
!=1111				0	1	1	0	1	1	1	sat_imm	Rd	imm5	sh	0	1	Rn			
cond																				

Arithmetic shift right variant

Applies when `sh == 1`.

USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>

Logical shift left variant

Applies when `sh == 0`.

USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm5);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	0
1	1	1	1	0	(0)	1	1	1	0	sh	0	Rn	0	imm3	Rd	imm2	(0)	sat_imm					

Arithmetic shift right variant

Applies when `sh == 1 && !(imm3 == 000 && imm2 == 00)`.

USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>

Logical shift left variant

Applies when `sh == 0`.

USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}

Decode for all variants of this encoding

```
if sh == '1' && (imm3:imm2) == '0000' then SEE USAT16;
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm3:imm2);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F2-2396.
- <q> See *Standard assembler syntax fields* on page F2-2396.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <imm> Is the bit position for saturation, in the range 0 to 31, encoded in the "sat_imm" field.
- <Rn> Is the general-purpose source register, encoded in the "Rn" field.
- <amount> For encoding A1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.
For encoding A1: is the shift amount, in the range 1 to 32 encoded in the "imm5" field as <amount> modulo 32.
For encoding T1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm3:imm2" field.
For encoding T1: is the shift amount, in the range 1 to 31 encoded in the "imm3:imm2" field as <amount>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand = Shift(R[n], shift_t, shift_n, PSTATE.C); // PSTATE.C ignored
    (result, sat) = UnsignedSatQ(SInt(operand), saturate_to);
    R[d] = ZeroExtend(result, 32);
    if sat then
        PSTATE.Q = '1';
```

F5.1.280 USAT16

Unsigned Saturate 16 saturates two signed 16-bit values to a selected unsigned range.

This instruction sets `PSTATE.Q` to 1 if the operation saturates.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

```

F5.1.292 YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a YIELD instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction see [The Yield instruction on page F1-2375](#).

F5.2 Encoding and use of Banked register transfer instructions

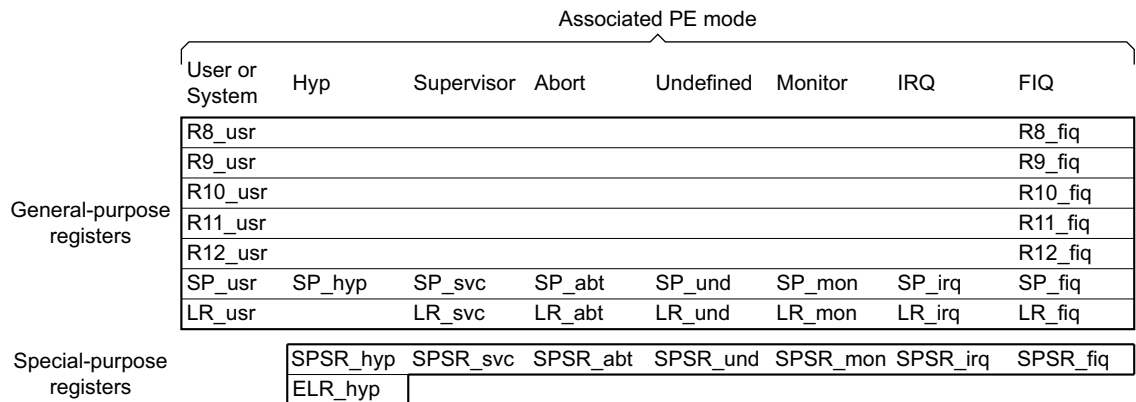

Software executing at EL1 or higher can use the MRS (Banked register) and MSR (Banked register) instructions to transfer values between the general-purpose registers and Special-purpose registers. One particular use of these instructions is for a hypervisor to save or restore the register values of a Guest OS. The following sections give more information about these instructions:

- [Register arguments in the Banked register transfer instructions.](#)
- [Usage restrictions on the Banked register transfer instructions on page F5-3215.](#)
- [Encoding the register argument in the Banked register transfer instructions on page F5-3216.](#)
- [Pseudocode support for the Banked register transfer instructions on page F5-3217.](#)

For descriptions of the instructions see [MRS \(Banked register\) on page F5-2821](#) and [MSR \(Banked register\) on page F5-2824](#).

F5.2.1 Register arguments in the Banked register transfer instructions

Figure F5-1 shows the Banked general-purpose registers and Special-purpose registers:

For the general-purpose registers, if no other register is shown, the *current mode register* is the `_usr` register. So, for example, the full set of current mode registers, including the registers that are not banked:

- For Hyp mode, is {R0_usr - R12_usr, SP_hyp, LR_usr, SPSR_hyp, ELR_hyp}.
- For Abort mode, is {R0_usr - R12_usr, SP_abt, LR_abt, SPSR_abt}.

Figure F5-1 Banking of general-purpose and Special-purpose registers

Figure F5-1 is based on [Figure G1-2 on page G1-3783](#), that shows the complete set of general-purpose registers and Special-purpose registers accessible in each mode.

Note

- System mode uses the same set of registers as User mode. Neither of these modes can access an **SPSR**, except that System mode can use the MRS (Banked register) and MSR (Banked register) instructions to access some **SPSRs**, as described in [Usage restrictions on the Banked register transfer instructions on page F5-3215](#).
- General-purpose registers R0-R7, that are not Banked, cannot be accessed using the MRS (Banked register) and MSR (Banked register) instructions.
- In addition to the registers shown in [Figure F5-1](#), the **DLR** and **DSPSR** are AArch32 System registers that map onto the AArch64 Special-purpose registers **DLR_EL0** and **DSPSR_EL0**. However, **DLR** and **DSPSR** are not accessible using the MRS (Banked register) and MSR (Banked register) instructions.

Software using an MRS (Banked register) or MSR (Banked register) instruction specifies one of these registers using a name shown in [Figure F5-1](#), or an alternative name for SP or LR. These registers can be grouped as follows:

R8-R12 Each of these registers has two Banked copies, `_usr` and `_fiq`, for example R8_usr and R8_fiq.

SP	There is a Banked copy of SP for every mode except System mode. For example, SP_svc is the SP for Supervisor mode.
LR	There is a Banked copy of LR for every mode except System mode and Hyp mode. For example, LR_svc is the LR for Supervisor mode.
SPSR	There is a Banked copy of SPSR for every mode except System mode and User mode.
ELR_hyp	Except for the operations provided by MRS (Banked register) and MSR (Banked register), ELR_hyp is accessible only from Hyp mode. It is not Banked.

F5.2.2 Usage restrictions on the Banked register transfer instructions

MRS (Banked register) and MSR (Banked register) instructions are CONSTRAINED UNPREDICTABLE if any of the following applies:

- The instruction is executed in User mode.
- The instruction accesses a Banked register that is not implemented, or that either:
 - Is not accessible from the current Privilege level and Security state.
 - Can be accessed from the current mode by using a different instruction.

[MSR/MRS Banked registers on page K1-5468](#) describes the permitted CONSTRAINED UNPREDICTABLE behavior.

An MRS (Banked register) or an MSR (Banked register) executed:

- At Non-secure EL1 cannot access any Hyp mode Banked registers.
- At Non-secure EL1 or EL2 cannot access any Monitor mode Banked registers.
- In a Secure mode other than Monitor mode cannot access any Hyp Banked registers.

This means that the Banked registers that MRS (Banked register) and MSR (Banked register) instructions cannot access are:

From Monitor mode

- The current mode registers R8_usr-R12_usr, SP_mon, LR_mon, and SPSR_mon.

From Hyp mode

- The Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The current mode registers R8_usr-R12_usr, SP_hyp, LR_usr, and SPSR_hyp.

———— Note —————

MRS (Banked register) and MSR (Banked register) instructions can access the current mode register [ELR_hyp](#).

From FIQ mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and [ELR_hyp](#).
- The current mode registers R8_fiq-R12_fiq, SP_fiq, LR_fiq, and SPSR_fiq.

From System mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and [ELR_hyp](#).
- The current mode registers R8_usr-R12_usr, SP_usr, and LR_usr.

From Supervisor mode, Abort mode, Undefined mode, and IRQ mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and [ELR_hyp](#).
- The current mode registers R8_usr-R12_usr, SP_<current_mode>, LR_<current_mode>, and SPSR_<current_mode>.

If EL3 is using AArch64, all MRS (Banked register) and MSR (Banked register) accesses to the Monitor mode registers from Secure EL1 modes are trapped to EL3. See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32* on page D1-1588.

For more information, see:

- [Encoding the register argument in the Banked register transfer instructions.](#)
- [Pseudocode support for the Banked register transfer instructions](#) on page F5-3217.
- [MRS \(Banked register\)](#) on page F5-2821.
- [MSR \(Banked register\)](#) on page F5-2824.

———— **Note** ————

CONSTRAINED UNPREDICTABLE behavior must not give access to registers that are not accessible from the current Privilege level and Security state.

F5.2.3 Encoding the register argument in the Banked register transfer instructions

The MRS (Banked register) and MSR (Banked register) instructions include a 5-bit field, SYSm, and an R bit, that together encode the register argument for the instruction.

When the R bit is set to 0, the argument is a register other than a Banked copy of the SPSR, and [Table F5-1](#) shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

Table F5-1 Banked register encodings when R==0

SYSm<4:3>				
SYSm<2:0>	0b00	0b01	0b10	0b11

F5.2.4 Pseudocode support for the Banked register transfer instructions

The pseudocode functions `BankedRegisterAccessValid()` and `SPSRAccessValid()` check the validity of MRS (Banked register) and MSR (Banked register) accesses. That is, they filter the accesses that are CONSTRAINED UNPREDICTABLE either because:

- They attempt to access a register that *Usage restrictions on the Banked register transfer instructions on page F5-3215* shows is not accessible.
- They use an SYSm<4:0> encoding that *Encoding the register argument in the Banked register transfer instructions on page F5-3216* shows as CONSTRAINED UNPREDICTABLE.

`BankedRegisterAccessValid()` applies to accesses to the banked general-purpose registers, or to `ELR_hyp`, and `SPSRAccessValid()` applies to accesses to the `SPSRs`.

Chapter F6

T32 and A32 Advanced SIMD and floating-point Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- [Alphabetical list of floating-point and Advanced SIMD instructions on page F6-3220.](#)

———— **Note** —————

Some headings in this chapter use the term *floating-point register*. This is an abbreviated description, and means a register in the Advanced SIMD and floating-point register file.

F6.1 Alphabetical list of floating-point and Advanced SIMD instructions

This section lists every floating-point and Advanced SIMD instruction in the T32 and A32 instruction sets. For details of the format used see [Format of instruction descriptions on page F2-2392](#).

This section is formatted so that each instruction description starts on a new page.

F6.1.1 AESD

AES single round decryption.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	0	1	M	0	Vm			

A1 variant

AESD.<dt> <Qd>, <Qm>

Decode for this encoding

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	1	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	0	1	M	0	Vm			

T1 variant

AESD.<dt> <Qd>, <Qm>

Decode for this encoding

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = 00

The following encodings are reserved:

- size = 01.
- size = 1x.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    op1 = Q[d>>1]; op2 = Q[m>>1];
    Q[d>>1] = AESInvSubBytes(AESInvShiftRows(op1 EOR op2));
```

F6.1.2 AESE

AES single round encryption.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	0	0	M	0	Vm			

A1 variant

AESE.<dt> <Qd>, <Qm>

Decode for this encoding

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	1	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	0	0	M	0	Vm			

T1 variant

AESE.<dt> <Qd>, <Qm>

Decode for this encoding

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = 00

The following encodings are reserved:

- size = 01.
- size = 1x.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    op1 = Q[d>>1]; op2 = Q[m>>1];
    Q[d>>1] = AESSubBytes(AESShiftRows(op1 EOR op2));
```

F6.1.3 AESIMC

AES inverse mix columns.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0

A1 variant

AESIMC.<dt> <Qd>, <Qm>

Decode for this encoding

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	1	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	1	1	M	0	Vm			

T1 variant

AESIMC.<dt> <Qd>, <Qm>

Decode for this encoding

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
if InITBlock() then UNPREDICTABLE;
```

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = 00

The following encodings are reserved:

- size = 01.
- size = 1x.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    Q[d>>1] = AESInvMixColumns(Q[m>>1]);
```

F6.1.4 AESMC

AES mix columns.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	1	0	M	0	Vm			

A1 variant

AESMC.<dt> <Qd>, <Qm>

Decode for this encoding

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	1	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	1	0	M	0	Vm			

T1 variant

AESMC.<dt> <Qd>, <Qm>

Decode for this encoding

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = 00

The following encodings are reserved:

- size = 01.
- size = 1x.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    Q[d>>1] = AESMixColumns(Q[m>>1]);
```

F6.1.5 FLDMDBX, FLDMIAX

FLDMX loads multiple SIMD&FP registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register.

ARM deprecates use of FLDMDBX and FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

FLDMDBX{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VLDR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as a VLDM with the same addressing mode but loads no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD or floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

T1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

FLDMDBX{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VLDR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as a VLDM with the same addressing mode but loads no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD or floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD and floating-point 64-bit move on page F3-2438](#) for the T32 instruction set, or [Advanced SIMD and floating-point 64-bit move on page F4-2522](#) for the A32 instruction set.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.
For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
- ! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
- <reglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            S[d+r] = MemA[address,4]; address = address+4;
        else
            word1 = MemA[address,4]; word2 = MemA[address+4,4]; address = address+8;
            // Combine the word-aligned words in the correct order for current endianness.
            D[d+r] = if BigEndian() then word1:word2 else word2:word1;
    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

F6.1.6 FSTMDBX, FSTMIAX

FSTMX stores multiple SIMD&FP registers from the Advanced SIMD and floating-point register file to consecutive locations in using an address from a general-purpose register.

ARM deprecates use of FLDMDBX and FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

FSTMDBX{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

FSTMIAX{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VSTR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FSTMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as a VSTM with the same addressing mode but stores no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

FSTMDBX{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

FSTMIAX{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VSTR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FSTMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes as a VSTM with the same addressing mode but stores no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD and floating-point 64-bit move on page F3-2438](#) for the T32 instruction set, or [Advanced SIMD and floating-point 64-bit move on page F4-2522](#) for the A32 instruction set.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used. However, ARM deprecates use of the PC.
For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
- ! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
- <dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            MemA[address,4] = S[d+r]; address = address+4;
        else
            // Store as two word-aligned words in the correct order for current endianness.
            MemA[address,4] = if BigEndian() then D[d+r]<63:32> else D[d+r]<31:0>;
            MemA[address+4,4] = if BigEndian() then D[d+r]<31:0> else D[d+r]<63:32>;
            address = address+8;
    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

F6.1.7 SHA1C

SHA1 hash update (choose).

```

F6.1.17 VABA

Vector Absolute Difference and Accumulate subtracts the elements of one vector from the corresponding elements of another vector, and accumulates the absolute values of the results into the elements of the destination vector.

Operand and result elements are all integers of the same length.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#). An A32 Advanced SIMD VABS instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VABS instruction is unconditional, see [Conditional execution on page F2-2397](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

- <dt> Is the data type for the elements of the vectors, encoded in the "F:size" field. It can have the following values:
- S8 when F = 0, size = 00
 - S16 when F = 0, size = 01
 - S32 when F = 0, size = 10
 - F32 when F = 1, size = 10
- The following encodings are reserved:
- F = 0, size = 11.
 - F = 1, size = 0x.
 - F = 1, size = 11.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
  if advsimd then // Advanced SIMD instruction
    for r = 0 to regs-1
      for e = 0 to elements-1
        if floating_point then
          Elem[D[d+r],e,esize] = FPAbs(Elem[D[m+r],e,esize]);
        else
          result = Abs(SInt(Elem[D[m+r],e,esize]));
          Elem[D[d+r],e,esize] = result<esize-1:0>;
  else // VFP instruction
    if dp_operation then
      D[d] = FPAbs(D[m]);
    else
      S[d] = FPAbs(S[m]);
  
```

F6.1.23 VACGE

Vector Absolute Compare Greater Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements must be 32-bit floating-point numbers.

The result vector elements are 32-bit fields.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the alias VACLE. See [Alias conditions on page F6-3265](#) for details of when each alias is preferred.

A1

64-bit SIMD vector variant

Applies when Q == 0.

```

Alias conditions

Alias	is preferred when
VACLE	Never

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VACGE, VACGT, VACLE, or VACLT instruction must be unconditional. ARM strongly recommends that a T32 VACGE, VACGT, VACLE, or VACLT instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = FPAbs(Elem[D[n+r],e,esize]); op2 = FPAbs(Elem[D[m+r],e,esize]);
      if or_equal then
        test_passed = FPCompareGE(op1, op2, StandardFPSCRValue());
      else
        test_passed = FPCompareGT(op1, op2, StandardFPSCRValue());
      Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
  
```

F6.1.24 VACLE

Vector Absolute Compare Less Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is less than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros

This instruction is an alias of the [VACGE](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VACGE](#).
- The description of [VACGE](#) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VACLE{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

is equivalent to

VACGE{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VACLE{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

is equivalent to

VACGE{<c>}{<q>}.F32 <Qd>, <Qm>, <Qn>

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

Applies when Q == 0.

VACLE{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

is equivalent to

VACGE{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VACLE{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

is equivalent to

VACGE{<c>}{<q>}.F32 <Qd>, <Qm>, <Qn>

and is never the preferred disassembly.

Assembler symbols

- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VACGE, VACGT, VACLE, or VACLT instruction must be unconditional. ARM strongly recommends that a T32 VACGE, VACGT, VACLE, or VACLT instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Operation for all encodings

The description of [VACGE](#) gives the operational pseudocode for this instruction.

F6.1.25 VACGT

Vector Absolute Compare Greater Than takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements must be 32-bit floating-point numbers.

The result vector elements are 32-bit fields.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the alias VACLT. See [Alias conditions on page F6-3269](#) for details of when each alias is preferred.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VACGT{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VACGT{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
or_equal = (op == '0');  esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VACGT{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VACGT{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
or_equal = (op == '0'); esize = 32; elements = 2;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

Alias conditions

Alias	is preferred when
VACLT	Never

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VACGE, VACGT, VACLE, or VACLT instruction must be unconditional. ARM strongly recommends that a T32 VACGE, VACGT, VACLE, or VACLT instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = FPAbs(Elem[D[n+r],e,esize]); op2 = FPAbs(Elem[D[m+r],e,esize]);
      if or_equal then
        test_passed = FPCompareGE(op1, op2, StandardFPSCRValue());
      else
        test_passed = FPCompareGT(op1, op2, StandardFPSCRValue());
      Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
  
```

F6.1.26 VACLT

Vector Absolute Compare Less Than takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is less than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros

This instruction is an alias of the [VACGT](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VACGT](#).
- The description of [VACGT](#) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VACLT{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

is equivalent to

VACGT{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VACLT{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

is equivalent to

VACGT{<c>}{<q>}.F32 <Qd>, <Qm>, <Qn>

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

Applies when Q == 0.

VACLT{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

is equivalent to

VACGT{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VACLT{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

is equivalent to

VACGT{<c>}{<q>}.F32 <Qd>, <Qm>, <Qn>

and is never the preferred disassembly.

Assembler symbols

- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VACGE, VACGT, VACLE, or VACLT instruction must be unconditional. ARM strongly recommends that a T32 VACGE, VACGT, VACLE, or VACLT instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Operation for all encodings

The description of [VACGT](#) gives the operational pseudocode for this instruction.

F6.1.27 VADD (floating-point)

Vector Add (floating-point) adds corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

1	1	1	0	1	1	1	1	0	D	size	Vn	Vd	1	0	0	0	N	Q	M	0	Vm				

64-bit SIMD vector variant

Applies when Q == 0.

VADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
 esize = 8 << UInt(size); elements = 64 DIV esize;
 d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#). An A32 Advanced SIMD VADD instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VADD instruction is unconditional, see [Conditional execution on page F2-2397](#).

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:
- I8 when size = 00
 - I16 when size = 01
 - I32 when size = 10
 - I64 when size = 11
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = Elem[D[n+r],e,esize] + Elem[D[m+r],e,esize];
```

F6.1.29 VADDHN

Vector Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are truncated. For rounded results, see [VRADDHN](#).

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

A1 variant

VADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>

        else
            op1 = Int(Elem[Din[n],e,esize], unsigned);
        result = op1 + Int(Elem[Din[m],e,esize], unsigned);
        Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;
```

F6.1.32 VAND (immediate)

Vector Bitwise AND (immediate) performs a bitwise AND between a register value and an immediate value, and returns the result into the destination vector

This instruction is an alias of the [VBIC \(immediate\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VBIC \(immediate\)](#).
- The description of [VBIC \(immediate\)](#) gives the operational pseudocode for this instruction.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	16	15	12	11	8	7	6	5	4	3	0
1	1	1	1	0	0	1	i	1	D	0	0	0	imm3	Vd	cmode	0	Q	1	1	imm4				

64-bit SIMD vector variant

Applies when Q == 0.

VAND{<c>}{<q>}.<dt> {<Dd>}, <Dd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.<dt> <Dd>, #~<imm>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VAND{<c>}{<q>}.<dt> {<Qd>}, <Qd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.<dt> <Qd>, #~<imm>

and is never the preferred disassembly.

64-bit SIMD vector variant

Applies when Q == 0.

VAND{<c>}{<q>}.<dt> {<Dd>}, <Dd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.<dt> <Dd>, #~<imm>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VAND{<c>}{<q>}.<dt> {<Qd>}, <Qd>, #<imm>

is equivalent to

`VBIC{<c>}{<q>}.<dt> <Qd>, #~<imm>`

and is never the preferred disassembly.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VORR instruction must be unconditional. ARM strongly recommends that a T32 VORR instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> The data type used for <imm>. It can be either I16 or I32. I8, I64, and F32 are also permitted, but the resulting syntax is a pseudo-instruction.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <imm> Is a constant of the type specified by <dt> that is replicated to fill the destination register. For details of the range of constants available and the encoding of <dt> and <imm>, see [Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F2-2412](#).

Operation for all encodings

The description of [VBIC \(immediate\)](#) gives the operational pseudocode for this instruction.

F6.1.33 VAND (register)

Vector Bitwise AND (register) performs a bitwise AND operation between two registers, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

64-bit SIMD vector variant

Applies when Q == 0.

VAND{<c>}{<q>}{.<dt>} {<Dd>}, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VAND{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
 d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VAND instruction must be unconditional. ARM strongly recommends that a T32 VAND instruction is unconditional, see [Conditional execution on page F2-2397](#).

- <q> See *Standard assembler syntax fields* on page F2-2396.
- <dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] AND D[m+r];
```

F6.1.34 VBIC (immediate)

Vector Bitwise Bit Clear (immediate) performs a bitwise AND between a register value and the complement of an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the alias VAND (immediate). See [Alias conditions on page F6-3288](#) for details of when each alias is preferred.

 d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VBIC instruction must be unconditional. ARM strongly recommends that a T32 VBIC instruction is unconditional, see [Conditional execution on page F2-2397](#).

<q>	See <i>Standard assembler syntax fields</i> on page F2-2396.
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] AND NOT(D[m+r]);
```

F6.1.36 VBIF

Vector Bitwise Insert if False inserts each bit from the first source register into the destination register if the corresponding bit of the second source register is 0, otherwise leaves the bit in the destination register unchanged.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

F6.1.39 VCEQ (immediate #0)

Vector Compare Equal to Zero takes each element in a vector, and compares it with zero. If it is equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.
- 32-bit floating-point numbers.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

                test_passed = FPCompareEQ(op1, op2, StandardFPSCRValue());
            Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
  
```

F6.1.41 VCGE (immediate #0)

Vector Compare Greater Than or Equal to Zero takes each element in a vector, and compares it with zero. If it is greater than or equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 32-bit floating-point numbers.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

 - U = 1, size = 11.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
enumeration VCGTtype {VCGTtype_signed, VCGTtype_unsigned, VCGTtype_fp};

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Elem[D[n+r],e,esize]; op2 = Elem[D[m+r],e,esize];
      case type of
        when VCGTtype_signed test_passed = (SInt(op1) > SInt(op2));
```

```
when VCGTtype_unsigned test_passed = (UInt(op1) > UInt(op2));  
when VCGTtype_fp       test_passed = FPCompareGT(op1, op2, StandardFPSRValue());  
Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
```

F6.1.45 VCLE (immediate #0)

Vector Compare Less Than or Equal to Zero takes each element in a vector, and compares it with zero. If it is less than or equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 32-bit floating-point numbers.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Operation for all encodings

The description of [VCGE \(register\)](#) gives the operational pseudocode for this instruction.

F6.1.47 VCLS

Vector Count Leading Sign Bits counts the number of consecutive bits following the topmost bit, that are the same as the topmost bit, in each element in a vector, and places the results in a second vector. The count does not include the topmost bit itself.

The operand vector elements can be any one of 8-bit, 16-bit, or 32-bit signed integers.

The result vector elements are the same data type as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

1	1	1	1	1	1	1	1	0	D	1	sz	Vn	Vd	1	1	1	0	N	Q	M	0	Vm			

64-bit SIMD vector variant

Applies when Q == 0.

VCLT{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

is equivalent to

VCGT{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VCLT{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

is equivalent to

VCGT{<c>}{<q>}.F32 <Qd>, <Qm>, <Qn>

and is never the preferred disassembly.

Assembler symbols

- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VCGT instruction must be unconditional. ARM strongly recommends that a T32 VCGT instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
- | | |
|-----|-----------------------|
| S8 | when U = 0, size = 00 |
| S16 | when U = 0, size = 01 |
| S32 | when U = 0, size = 10 |
| U8 | when U = 1, size = 00 |
| U16 | when U = 1, size = 01 |
| U32 | when U = 1, size = 10 |
- The following encodings are reserved:
- U = 0, size = 11.
 - U = 1, size = 11.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Operation for all encodings

The description of [VCGT \(register\)](#) gives the operational pseudocode for this instruction.

F6.1.50 VCLZ

Vector Count Leading Zeros counts the number of consecutive zeros, starting from the most significant bit, in each element in a vector, and places the results in a second vector.

The operand vector elements can be any one of 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.

The result vector elements are the same data type as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VCLZ instruction must be unconditional. ARM strongly recommends that a T32 VCLZ instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
 - I8 when size = 00
 - I16 when size = 01
 - I32 when size = 10
 The encoding size = 11 is reserved.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      Elem[D[d+r],e,esize] = CountLeadingZeroBits(Elem[M[m+r],e,esize])<esize-1:0>;
  
```

F6.1.51 VCOMP

Vector Compare compares two floating-point registers, or one floating-point register and zero. It writes the result to the **FPSCR** flags. These are normally transferred to the **PSTATE**.{N, Z, C, V} Condition flags by a subsequent **VMRS** instruction.

It raises an Invalid Operation exception only if either operand is a signaling NaN.

Depending on settings in the **CPACR**, **NSACR**, and **HCPTR** registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be **UNDEFINED**, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Single-precision scalar variant

d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

NaNs

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This results in the **FPSCR** flags being set as N=0, Z=0, C=1 and V=1.

VCMP_E raises an Invalid Operation exception if either operand is any type of NaN, and is suitable for testing for <, <=, >, >=, and other predicates that raise an exception when the operands are unordered.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    if dp_operation then
        bits(64) op64 = if with_zero then FPZero('0') else D[m];
        FPSCR.<N,Z,C,V> = FPCompare(D[d], op64, quiet_nan_exc, FPSCR);
    else
        bits(32) op32 = if with_zero then FPZero('0') else S[m];
        FPSCR.<N,Z,C,V> = FPCompare(S[d], op32, quiet_nan_exc, FPSCR);
```

F6.1.52 VCMPE

Vector Compare, raising Invalid Operation on NaN compares two floating-point registers, or one floating-point register and zero. It writes the result to the FPSCR flags. These are normally transferred to the PSTATE.{N, Z, C, V} Condition flags by a subsequent VMRS instruction.

It raises an Invalid Operation exception if either operand is any type of NaN.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

NaNs

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This results in the [FPSCR](#) flags being set as N=0, Z=0, C=1 and V=1.

VMPE raises an Invalid Operation exception if either operand is any type of NaN, and is suitable for testing for <, <=, >, >=, and other predicates that raise an exception when the operands are unordered.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    if dp_operation then
        bits(64) op64 = if with_zero then FPZero('0') else D[m];
        FPSCR.<N,Z,C,V> = FPCompare(D[d], op64, quiet_nan_exc, FPSCR);
    else
        bits(32) op32 = if with_zero then FPZero('0') else S[m];
        FPSCR.<N,Z,C,V> = FPCompare(S[d], op32, quiet_nan_exc, FPSCR);
```

F6.1.53 VCNT

Vector Count Set Bits counts the number of bits that are one in each element in a vector, and places the results in a second vector.

The operand vector elements must be 8-bit fields.

The result vector elements are 8-bit integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VCNT{<c>}{<q>}.8 <Dd>, <Dm> // Encoded as Q = 0

128-bit SIMD vector variant

Applies when Q == 1.

VCNT{<c>}{<q>}.8 <Qd>, <Qm> // Encoded as Q = 1

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8; elements = 8;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VCNT instruction must be unconditional. ARM strongly recommends that a T32 VCNT instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = BitCount(Elem[D[m+r],e,esize])<esize-1:0>;
```

F6.1.54 VCVT (between double-precision and single-precision)

Convert between double-precision and single-precision does one of the following:

- Converts the value in a double-precision register to single-precision and writes the result to a single-precision register.
- Converts the value in a single-precision register to double-precision and writes the result to a double-precision register.

Depending on settings in the [CPACR](#), [NSACR](#), [HCPTR](#), and [FPEXC](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();  
  for e = 0 to elements-1  
    if half_to_single then  
      Elem[Q[d>>1],e,32] = FPConvert(Elem[Din[m],e,16], StandardFPSCRValue());  
    else  
      Elem[D[d],e,16] = FPConvert(Elem[Qin[m>>1],e,32], StandardFPSCRValue());
```

F6.1.56 VCVT (between floating-point and integer, Advanced SIMD)

Vector Convert between floating-point and integer converts each element in a vector from floating-point to integer, or from integer to floating-point, and places the results in a second vector.

The vector elements must be 32-bit floating-point numbers, or 32-bit integers. Signed and unsigned integers are distinct.

The floating-point to integer operation uses the Round towards Zero rounding mode. The integer to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 Advanced SIMD VCVT instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VCVT instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt1> Is the data type for the elements of the destination vector, encoded in the "op:U" field. It can have the following values:
 - F32 when op = 0, U = 0
 - F32 when op = 0, U = 1
 - S32 when op = 1, U = 0
 - U32 when op = 1, U = 1
- <dt2> Is the data type for the elements of the source vector, encoded in the "op:U" field. It can have the following values:
 - S32 when op = 0, U = 0
 - U32 when op = 0, U = 1
 - F32 when op = 1, U = 0
 - F32 when op = 1, U = 1
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
- <fbits> The number of fraction bits in the fixed point number, in the range 1 to 32:
 - (64 - <fbits>) is encoded in imm6.

An assembler can permit an <fbits> value of 0. This is encoded as floating-point to integer or integer to floating-point instruction, see [VCVT \(between floating-point and integer, Advanced SIMD\)](#).

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  bits(esize) result;
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Elem[D[m+r],e,esize];
  
```

```
if to_fixed then
    result = FPToFixed(op1, frac_bits, unsigned, StandardFPSCRValue(),
                      FPRounding_ZERO);
else
    result = FixedToFP(op1, frac_bits, unsigned, StandardFPSCRValue(),
                      FPRounding_TIEEVEN);
Elem[D[d+r],e,esize] = result;
```

F6.1.60 VCVT (between floating-point and fixed-point, floating-point)

Convert between floating-point and fixed-point converts a value in a register from floating-point to fixed-point, or from fixed-point to floating-point. Software can specify the fixed-point value as either signed or unsigned.

The floating-point value can be single-precision or double-precision.

The fixed-point value can be 16-bit or 32-bit. Conversions from fixed-point values take their operand from the low-order bits of the source register and ignore any remaining bits. Signed conversions to fixed-point values sign-extend the result value to the destination register width. Unsigned conversions to fixed-point values zero-extend the result value to the destination register width.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Single-precision scalar variant

Applies when `op == 0` && `sf == 0`.

VCVT{<c>}{<q>}.F32.<dt> <Sdm>, <Sdm>, #<fbits>

Single-precision scalar variant

Applies when `op == 1` && `sf == 0`.

VCVT{<c>}{<q>}.<dt>.F32 <Sdm>, <Sdm>, #<fbits>

Double-precision scalar variant

Applies when `op == 0` && `sf == 1`.

VCVT{<c>}{<q>}.F64.<dt> <Ddm>, <Ddm>, #<fbits>

Double-precision scalar variant

Applies when `op == 1` && `sf == 1`.

VCVT{<c>}{<q>}.<dt>.F64 <Ddm>, <Ddm>, #<fbits>

Decode for all variants of this encoding

```
to_fixed = (op == '1'); unsigned = (U == '1');
size = if sx == '0' then 16 else 32;
frac_bits = size - UInt(imm4:i);
dp_operation = (sf == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
if frac_bits < 0 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `frac_bits < 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

T1

```

CONSTRAINED UNPREDICTABLE behavior

If `frac_bits < 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

`<c>` See [Standard assembler syntax fields on page F2-2396](#).

`<q>` See [Standard assembler syntax fields on page F2-2396](#).

- <dt> Is the data type for the fixed-point number, encoded in the "U:sx" field. It can have the following values:
- S16 when U = 0, sx = 0
 - S32 when U = 0, sx = 1
 - U16 when U = 1, sx = 0
 - U32 when U = 1, sx = 1
- <Sdm> Is the 32-bit name of the SIMD&FP destination and source register, encoded in the "Vd:D" field.
- <Ddm> Is the 64-bit name of the SIMD&FP destination and source register, encoded in the "D:Vd" field.
- <fbits> The number of fraction bits in the fixed-point number:
- If <dt> is S16 or U16, <fbits> must be in the range 0-16. (16 - <fbits>) is encoded in [imm4, i]
 - If <dt> is S32 or U32, <fbits> must be in the range 1-32. (32 - <fbits>) is encoded in [imm4, i].

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    if to_fixed then
        bits(size) result;
        if dp_operation then
            result = FPToFixed(D[d], frac_bits, unsigned, FPSCR, FPRounding_ZERO);
            D[d] = Extend(result, 64, unsigned);
        else
            result = FPToFixed(S[d], frac_bits, unsigned, FPSCR, FPRounding_ZERO);
            S[d] = Extend(result, 32, unsigned);
    else
        if dp_operation then
            D[d] = FixedToFP(D[d]<size-1:0>, frac_bits, unsigned, FPSCR, FPRounding_TIEEVEN);
        else
            S[d] = FixedToFP(S[d]<size-1:0>, frac_bits, unsigned, FPSCR, FPRounding_TIEEVEN);
```

F6.1.61 VCVTA (Advanced SIMD)

Vector Convert floating-point to integer with Round to Nearest with Ties to Away converts each element in a vector from floating-point to integer using the Round to Nearest with Ties to Away rounding mode, and places the results in a second vector.

The operand vector elements must be 32-bit floating-point numbers.

The result vector elements are 32-bit integers. Signed and unsigned integers are distinct.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckVFPEEnabled(TRUE);  
if dp_operation then  
    S[d] = FPToFixed(D[m], 0, unsigned, FPSCR, rounding);  
else  
    S[d] = FPToFixed(S[m], 0, unsigned, FPSCR, rounding);
```

F6.1.63 VCVTB

Convert to or from a half-precision value in the bottom half of a single-precision register does one of the following:

- Converts the half-precision value in the bottom half of a single-precision register to single-precision and writes the result to a single-precision register.
- Converts the half-precision value in the bottom half of a single-precision register to double-precision and writes the result to a double-precision register.
- Converts the single-precision value in a single-precision register to half-precision and writes the result into the bottom half of a single-precision register, preserving the other half of the destination register.
- Converts the double-precision value in a double-precision register to half-precision and writes the result into the bottom half of a single-precision register, preserving the other half of the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

F6.1.68 VCVTP (Advanced SIMD)

Vector Convert floating-point to integer with Round towards +Infinity converts each element in a vector from floating-point to integer using the Round towards +Infinity rounding mode, and places the results in a second vector.

The operand vector elements must be 32-bit floating-point numbers.

The result vector elements are 32-bit integers. Signed and unsigned integers are distinct.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VCVTP{<q>}.<dt>.F32 <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VCVTP{<q>}.<dt>.F32 <Qd>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size != '10' then UNDEFINED;
rounding = FPDecodeRM(RM); unsigned = (op == '1');
esize = 32; elements = 2;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
if InITBlock() then UNPREDICTABLE;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VCVTP{<q>}.<dt>.F32 <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VCVTP{<q>}.<dt>.F32 <Qd>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size != '10' then UNDEFINED;
rounding = FPDecodeRM(RM); unsigned = (op == '1');
esize = 32; elements = 2;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
if InITBlock() then UNPREDICTABLE;
  
```

Assembler symbols

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> For encoding A1: is the data type for the elements of the destination, encoded in the "op" field. It can have the following values:
- S32 when op = 0
 - U32 when op = 1
- For encoding T1: is the data type for the elements of the destination, encoded in the "op" field. It can have the following values:
- S32 when op = 0
 - U32 when op = 1
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

EncodingSpecificOperations(); CheckAdvSIMDEnabled();
bits(esize) result;
for r = 0 to regs-1
  for e = 0 to elements-1
    Elem[D[d+r],e,esize] = FPToFixed(Elem[D[m+r],e,esize], 0, unsigned,
      StandardFPSCRValue(), rounding);
  
```

F6.1.69 VCVTP (floating-point)

Convert floating-point to integer with Round towards +Infinity converts a value in a register from floating-point to a 32-bit integer using the Round towards +Infinity rounding mode, and places the result in a second register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Single-precision scalar variant

Applies when `sz == 0`.

VCVTP{<q>}.<dt>.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when `sz == 1`.

VCVTP{<q>}.<dt>.F64 <Sd>, <Dm>

Decode for all variants of this encoding

```
rounding = FPDecodeRM(RM); unsigned = (op == '0'); dp_operation = (sz == '1');
d = UInt(Vd:D); m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
if InITBlock() then UNPREDICTABLE;
```

T1

Single-precision scalar variant

Applies when `sz == 0`.

VCVTP{<q>}.<dt>.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when `sz == 1`.

VCVTP{<q>}.<dt>.F64 <Sd>, <Dm>

Decode for all variants of this encoding

```
rounding = FPDecodeRM(RM); unsigned = (op == '0'); dp_operation = (sz == '1');
d = UInt(Vd:D); m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
if InITBlock() then UNPREDICTABLE;
```

Assembler symbols

<q> See [Standard assembler syntax fields on page F2-2396](#).

- <dt> Is the data type for the elements of the destination, encoded in the "op" field. It can have the following values:
- U32 when op = 0
 - S32 when op = 1
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckVFPEnabled(TRUE);  
if dp_operation then  
    S[d] = FPToFixed(D[m], 0, unsigned, FPSCR, rounding);  
else  
    S[d] = FPToFixed(S[m], 0, unsigned, FPSCR, rounding);
```

F6.1.70 VCVTR

Convert floating-point to integer converts a value in a register from floating-point to a 32-bit integer, using the rounding mode specified by the [FPSCR](#) and places the result in a second register.

[VCVT \(between floating-point and fixed-point, floating-point\)](#) describes conversions between floating-point and 16-bit integers.

Depending on settings in the [CPACR](#), [NSACR](#), [HCPTR](#), and [FPEXC](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

else  
S[d] = FixedToFP(S[m], 0, unsigned, FPSCR, rounding);
```

F6.1.71 VCVTT

Convert to or from a half-precision value in the top half of a single-precision register does one of the following:

- Converts the half-precision value in the top half of a single-precision register to single-precision and writes the result to a single-precision register.
- Converts the half-precision value in the top half of a single-precision register to double-precision and writes the result to a double-precision register.
- Converts the single-precision value in a single-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.
- Converts the double-precision value in a double-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.

Depending on settings in the [CPACR](#), [NSACR](#), [HCPTR](#), and [FPEXC](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. ```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). ARM strongly recommends that any VDUP instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> The data size for the elements of the destination vector. It must be one of:
- | | |
|----|---------------------------|
| 8 | Encoded as [b, e] = 0b10. |
| 16 | Encoded as [b, e] = 0b01. |
| 32 | Encoded as [b, e] = 0b00. |
- <Qd> The destination vector for a quadword operation.
- <Dd> The destination vector for a doubleword operation.
- <Rt> The ARM source register.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    scalar = R[t]<size-1:0>;
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = scalar;
```

F6.1.74 VDUP (scalar)

Duplicate vector element to vector duplicates a single element of a vector into every element of the destination vector.

The scalar, and the destination vector elements, can be any one of 8-bit, 16-bit, or 32-bit fields. There is no distinction between data types.

For more information about scalars see *Advanced SIMD scalars* on page F2-2421.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3865.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  scalar = Elem[D[m],index,esize];
  for r = 0 to regs-1
    for e = 0 to elements-1
      Elem[D[d+r],e,esize] = scalar;
  
```

F6.1.75 VEOR

Vector Bitwise Exclusive OR performs a bitwise Exclusive OR operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	0	D	0	0	Vn	Vd	0	0	0	1	N	Q	M	1	Vm			

64-bit SIMD vector variant

Applies when Q == 0.

VEOR{<c>}{<q>}{.<dt>} {<Dd>}, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VEOR{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
 d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0

64-bit SIMD vector variant

Applies when Q == 0.

VEOR{<c>}{<q>}{.<dt>} {<Dd>}, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VEOR{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
 d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VEOR instruction must be unconditional. ARM strongly recommends that a T32 VEOR instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] EOR D[m+r];
```

F6.1.76 VEXT (byte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector.

The elements of the vectors are treated as being 8-bit fields. There is no distinction between data types.

The following figure shows an example of the operation of VEXT doubleword operation for imm = 3.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the alias **VEXT (multibyte elements)**. See [Alias conditions on page F6-3387](#) for details of when each alias is preferred.

```

Alias conditions

Alias	is preferred when
VEXT (multibyte elements)	Never

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VEXT instruction must be unconditional. ARM strongly recommends that a T32 VEXT instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
- <imm> For the 64-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to 7, encoded in the "imm4" field.
 For the 128-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to 15, encoded in the "imm4" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  if quadword_operation then
    Q[d>>1] = (Q[m>>1]:Q[n>>1])<position+127:position>;
  else
    D[d] = (D[m]:D[n])<position+63:position>;
```

F6.1.77 VEXT (multibyte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector

This instruction is an alias of the [VEXT \(byte elements\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VEXT \(byte elements\)](#).
- The description of [VEXT \(byte elements\)](#) gives the operational pseudocode for this instruction.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
1	1	1	1	0	0	1	0	1	D	1	1	Vn	Vd	imm4	N	Q	M	0	Vm				

64-bit SIMD vector variant

Applies when Q == 0.

VEXT{<c>}{<q>}.<size> {<Dd>}, <Dn>, <Dm>, #<imm>

is equivalent to

VEXT{<c>}{<q>}.8 {<Dd>}, <Dn>, <Dm>, #<imm>*(size/8)

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VEXT{<c>}{<q>}.<size> {<Qd>}, <Qn>, <Qm>, #<imm>

is equivalent to

VEXT{<c>}{<q>}.8 {<Qd>}, <Qn>, <Qm>, #<imm>*(size/8)

and is never the preferred disassembly.

```

F6.1.80 VFNMA

Vector Fused Negate Multiply Accumulate negates one floating-point register value and multiplies it by another floating-point register value, adds the negation of the floating-point value in the destination register to the product, and writes the result back to the destination register. The instruction does not round the result of the multiply before the addition.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Single-precision scalar variant

Applies when `sz == 0`.

VFNMA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>

Double-precision scalar variant

Applies when `sz == 1`.

VFNMA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
op1_neg = (op == '1');
dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

T1

Single-precision scalar variant

Applies when `sz == 0`.

VFNMA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>

Double-precision scalar variant

Applies when `sz == 1`.

VFNMA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
op1_neg = (op == '1');
dp_operation = (sz == '1');
```

```
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);  
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);  
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.
- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations(); CheckVFPEnabled(TRUE);  
  if dp_operation then  
    op64 = if op1_neg then FPNeg(D[n]) else D[n];  
    D[d] = FPMu1Add(FPNeg(D[d]), op64, D[m], FPSCR);  
  else  
    op32 = if op1_neg then FPNeg(S[n]) else S[n];  
    S[d] = FPMu1Add(FPNeg(S[d]), op32, S[m], FPSCR);
```

F6.1.81 VFNMS

Vector Fused Negate Multiply Subtract multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the product, and writes the result back to the destination register. The instruction does not round the result of the multiply before the addition.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Single-precision scalar variant

Applies when `sz == 0`.

Double-precision scalar variant

Applies when `sz == 1`.

VFNMS{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
op1_neg = (op == '1');
dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

T1

Single-precision scalar variant

Applies when `sz == 0`.

VFNMS{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>

Double-precision scalar variant

Applies when `sz == 1`.

VFNMS{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
op1_neg = (op == '1');
dp_operation = (sz == '1');
```

```
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);  
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);  
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F2-2396.
- <q> See *Standard assembler syntax fields* on page F2-2396.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.
- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations(); CheckVFPEEnabled(TRUE);  
  if dp_operation then  
    op64 = if op1_neg then FPNeg(D[n]) else D[n];  
    D[d] = FPMu1Add(FPNeg(D[d]), op64, D[m], FPSCR);  
  else  
    op32 = if op1_neg then FPNeg(S[n]) else S[n];  
    S[d] = FPMu1Add(FPNeg(S[d]), op32, S[m], FPSCR);
```

F6.1.82 VHADD

Vector Halving Add adds corresponding elements in two vectors of integers, shifts each result right one bit, and places the final results in the destination vector. The results of the halving operations are truncated. For rounded results, see [VRHADD](#)).

The operand and result elements are all the same type, and can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:

8	when size = 00
16	when size = 01
32	when size = 10
- <list> Is a list containing the single 64-bit name of the SIMD&FP register holding the element. The list must be { <Dd>[<index>] }. The register <Dd> is encoded in the "D:Vd" field. The permitted values and encoding of <index> depend on <size>:

<size> == 8	<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
<size> == 16	<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32	<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn>	Is the general-purpose base register, encoded in the "Rn" field.										
<align>	When <size> == 8, <align> must be omitted, otherwise it is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-2313 , and the encoding depends on <size>: <table><tr><td><size> == 8</td><td>Encoded in the "index_align<0>" field as 0.</td></tr><tr><td><size> == 16</td><td>Encoded in the "index_align<1:0>" field as 0b00.</td></tr><tr><td><size> == 32</td><td>Encoded in the "index_align<2:0>" field as 0b000.</td></tr></table> Whenever <align> is present, the permitted values and encoding depend on <size>: <table><tr><td><size> == 16</td><td><align> is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as 0b01.</td></tr><tr><td><size> == 32</td><td><align> is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as 0b011.</td></tr></table> : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-2416 .	<size> == 8	Encoded in the "index_align<0>" field as 0.	<size> == 16	Encoded in the "index_align<1:0>" field as 0b00.	<size> == 32	Encoded in the "index_align<2:0>" field as 0b000.	<size> == 16	<align> is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as 0b01.	<size> == 32	<align> is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as 0b011.
<size> == 8	Encoded in the "index_align<0>" field as 0.										
<size> == 16	Encoded in the "index_align<1:0>" field as 0b00.										
<size> == 32	Encoded in the "index_align<2:0>" field as 0b000.										
<size> == 16	<align> is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as 0b01.										
<size> == 32	<align> is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as 0b011.										
<Rm>	Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.										

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d],index] = MemU[address,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

F6.1.85 VLD1 (single element to all lanes)

Load single 1-element structure and replicate to all lanes of one register loads one element from memory into every element of one or two vectors. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-2416.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3865.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	1	0	0	1	D	1	0	Rn	Vd	1	1	0	0	size	T	a	Rm				

Offset variant

Applies when Rm == 1111.

VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]

Post-indexed variant

Applies when Rm == 1101.

VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!

Post-indexed variant

Applies when Rm != 11x1.

VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>

Decode for all variants of this encoding

```
if size == '11' || (size == '00' && a == '1') then UNDEFINED;
ebytes = 1 << UInt(size); regs = if T == '0' then 1 else 2;
alignment = if a == '0' then 1 else ebytes;
d = UInt(D:Vd); n = UInt(Rn); m = UInt(Rm);
wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If d+regs > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	0	0	1	1	D	1	0	Rn	Vd	1	1	0	0	size	T	a	Rm				

Offset variant

Applies when Rm == 1111.

VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]

Post-indexed variant

Applies when Rm == 1101.

VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!

Post-indexed variant

Applies when Rm != 11x1.

VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>

Decode for all variants of this encoding

```
if size == '11' || (size == '00' && a == '1') then UNDEFINED;
ebytes = 1 << UInt(size); regs = if T == '0' then 1 else 2;
alignment = if a == '0' then 1 else ebytes;
d = UInt(D:Vd); n = UInt(Rn); m = UInt(Rm);
wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If d+regs > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:

8	when size = 00
16	when size = 01
32	when size = 10

 The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:

{ <Dd>[] }	Encoded in the "T" field as 0.
{ <Dd>[], <Dd+1>[] }	Encoded in the "T" field as 1.

 The register <Dd> is encoded in the "D:Vd" field.

- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> When <size> == 8, <align> must be omitted, otherwise it is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and is encoded in the "a" field as 0. Whenever <align> is present, the permitted values and encoding depend on <size>:
- | | |
|--------------|---|
| <size> == 16 | <align> is 16, meaning 16-bit alignment, encoded in the "a" field as 1. |
| <size> == 32 | <align> is 32, meaning 32-bit alignment, encoded in the "a" field as 1. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    bits(64) replicated_element = Replicate(MemU[address,ebytes]);
    for r = 0 to regs-1
        D[d+r] = replicated_element;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

F6.1.86 VLD1 (multiple single elements)

Load multiple single 1-element structures to one, two, three, or four registers loads elements from memory into one, two, three, or four registers, without de-interleaving. Every element of each register is loaded. For details of the addressing mode see *The Advanced SIMD addressing mode on page F2-2416*.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-3865*.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD element or structure Load/Store on page F3-2469](#) for the T32 instruction set, or [Advanced SIMD element or structure Load/Store on page F4-2543](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
| 64 | when size = 11 |
- <list> Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:
- { <Dd> }
Encoded in the "type" field as 0b0111.
 - { <Dd>, <Dd+1> }
Encoded in the "type" field as 0b1010.
 - { <Dd>, <Dd+1>, <Dd+2> }
Encoded in the "type" field as 0b0110.
 - { <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
Encoded in the "type" field as 0b0010.
- The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and is encoded in the "align" field as 0b00. Whenever <align> is present, the permitted values are:
- | | |
|-----|---|
| 64 | 64-bit alignment, encoded in the "align" field as 0b01. |
| 128 | 128-bit alignment, encoded in the "align" field as 0b10. Available only if <list> contains two or four registers. |
| 256 | 256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            bits(ebytes*8) data;
            if ebytes != 8 then
                data = MemU[address,ebytes];
            else
                data<31:0> = if BigEndian() then MemU[address+4,4] else MemU[address,4];
  
```

```
        data<63:32> = if BigEndian() then MemU[address,4] else MemU[address+4,4];
        Elem[D[d+r],e] = data;
        address = address + ebytes;
if wback then
    if register_index then
        R[n] = R[n] + R[m];
    else
        R[n] = R[n] + 8*regs;
```

F6.1.87 VLD2 (single 2-element structure to one lane)

Load single 2-element structure to one lane of two registers loads one 2-element structure from memory into corresponding elements of two registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-2416.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3865.

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- <list> Is a list containing the 64-bit names of the two SIMD&FP registers holding the element. The list must be one of:
- { <Dd>[<index>], <Dd+1>[<index>] }
- Single-spaced registers, encoded as "spacing" = 0.
- { <Dd>[<index>], <Dd+2>[<index>] }
- Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.
- The encoding of "spacing" depends on <size>:
- | | |
|--------------|---|
| <size> == 16 | "spacing" is encoded in the "index_align<1>" field. |
| <size> == 32 | "spacing" is encoded in the "index_align<2>" field. |
- The register <Dd> is encoded in the "D:Vd" field. The permitted values and encoding of <index> depend on <size>:
- | | |
|--------------|--|
| <size> == 8 | <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field. |
| <size> == 16 | <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field. |
| <size> == 32 | <index> is 0 or 1, encoded in the "index_align<3>" field. |
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and the encoding depends on <size>:
- | | |
|--------------|--|
| <size> == 8 | Encoded in the "index_align<0>" field as 0. |
| <size> == 16 | Encoded in the "index_align<0>" field as 0. |
| <size> == 32 | Encoded in the "index_align<1:0>" field as 0b00. |
- Whenever <align> is present, the permitted values and encoding depend on <size>:
- | | |
|--------------|---|
| <size> == 8 | <align> is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1. |
| <size> == 16 | <align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1. |
| <size> == 32 | <align> is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as 0b01. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2],index] = MemU[address+ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
```

F6.1.88 VLD2 (single 2-element structure to all lanes)

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
 - 8 when size = 00
 - 16 when size = 01
 - 32 when size = 10
 The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of two SIMD&FP registers. The list must be one of:
 - { <Dd>[], <Dd+1>[] } Single-spaced registers, encoded in the "T" field as 0.
 - { <Dd>[], <Dd+2>[] } Double-spaced registers, encoded in the "T" field as 1.
 The register <Dd> is encoded in the "D:Vd" field.

- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and is encoded in the "a" field as 0. Whenever <align> is present, the permitted values and encoding depend on <size>:
- | | |
|--------------|---|
| <size> == 8 | <align> is 16, meaning 16-bit alignment, encoded in the "a" field as 1. |
| <size> == 16 | <align> is 32, meaning 32-bit alignment, encoded in the "a" field as 1. |
| <size> == 32 | <align> is 64, meaning 64-bit alignment, encoded in the "a" field as 1. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    D[d] = Replicate(MemU[address,ebytes]);
    D[d2] = Replicate(MemU[address+ebytes,ebytes]);
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
```

F6.1.89 VLD2 (multiple 2-element structures)

Load multiple 2-element structures to two or four registers loads multiple 2-element structures from memory into two or four registers, with de-interleaving. For more information, see *Element and structure load/store instructions on page F1-2378*. Every element of each register is loaded. For details of the addressing mode see *The Advanced SIMD addressing mode on page F2-2416*.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-3865*.

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD element or structure Load/Store on page F3-2469](#) for the T32 instruction set, or [Advanced SIMD element or structure Load/Store on page F4-2543](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:
- { <Dd>, <Dd+1> }
Single-spaced registers, encoded in the "type" field as 0b1000.
 - { <Dd>, <Dd+2> }
Double-spaced registers, encoded in the "type" field as 0b1001.
 - { <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
Single-spaced registers, encoded in the "type" field as 0b0011.
- The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and is encoded in the "align" field as 0b00. Whenever <align> is present, the permitted values are:
- | | |
|-----|--|
| 64 | 64-bit alignment, encoded in the "align" field as 0b01. |
| 128 | 128-bit alignment, encoded in the "align" field as 0b10. |
| 256 | 256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r], e] = MemU[address,ebytes];
            Elem[D[d2+r],e] = MemU[address+ebytes,ebytes];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*regs;
  
```

F6.1.90 VLD3 (single 3-element structure to one lane)

Load single 3-element structure to one lane of three registers loads one 3-element structure from memory into corresponding elements of three registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see *The Advanced SIMD addressing mode on page F2-2416*.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-3865*.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 . This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see Conditional execution on page F2-2397 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<size>	Is the data size, encoded in the "size" field. It can have the following values: 8 when size = 00 16 when size = 01 32 when size = 10
<list>	Is a list containing the 64-bit names of the three SIMD&FP registers holding the element. The list must be one of: { <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>] } Single-spaced registers, encoded as "spacing" = 0. { <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>] } Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8. The encoding of "spacing" depends on <size>: <size> == 8 "spacing" is encoded in the "index_align<0>" field. <size> == 16 "spacing" is encoded in the "index_align<1>" field, and "index_align<0>" is set to 0. <size> == 32 "spacing" is encoded in the "index_align<2>" field, and "index_align<1:0>" is set to 0b00. The register <Dd> is encoded in the "D:Vd" field. The permitted values and encoding of <index> depend on <size>: <size> == 8 <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field. <size> == 16 <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field. <size> == 32 <index> is 0 or 1, encoded in the "index_align<3>" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
<Rm>	Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Alignment

Standard alignment rules apply, see [Alignment support on page B2-75](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n];
    Elem[D[d], index] = MemU[address, ebytes];
    Elem[D[d2], index] = MemU[address+ebytes, ebytes];
    Elem[D[d3], index] = MemU[address+2*ebytes, ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 3*ebytes;
  
```

F6.1.91 VLD3 (single 3-element structure to all lanes)

```

CONSTRAINED UNPREDICTABLE behavior

If d3 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD element or structure Load/Store on page F3-2469](#) for the T32 instruction set, or [Advanced SIMD element or structure Load/Store on page F4-2543](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:
- { <Dd>, <Dd+1>, <Dd+2> }
Single-spaced registers, encoded in the "type" field as 0b0100.
- { <Dd>, <Dd+2>, <Dd+4> }
Double-spaced registers, encoded in the "type" field as 0b0101.
- The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and is encoded in the "align" field as 0b00. Whenever <align> is present, the only permitted values is 64, meaning 64-bit alignment, encoded in the "align" field as 0b01. : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about <Rn>, !, and <Rm>, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for e = 0 to elements-1
        Elem[D[d], e] = MemU[address,ebytes];
        Elem[D[d2],e] = MemU[address+ebytes,ebytes];
        Elem[D[d3],e] = MemU[address+2*ebytes,ebytes];
        address = address + 3*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 24;
```

F6.1.93 VLD4 (single 4-element structure to one lane)

Load single 4-element structure to one lane of four registers loads one 4-element structure from memory into corresponding elements of four registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-2416.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3865.

```

CONSTRAINED UNPREDICTABLE behavior

If d4 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- <list> Is a list containing the 64-bit names of the four SIMD&FP registers holding the element. The list must be one of:
- { <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>], <Dd+3>[<index>] }
- Single-spaced registers, encoded as "spacing" = 0.
- { <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>], <Dd+6>[<index>] }
- Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.
- The encoding of "spacing" depends on <size>:
- | | |
|--------------|---|
| <size> == 16 | "spacing" is encoded in the "index_align<1>" field. |
| <size> == 32 | "spacing" is encoded in the "index_align<2>" field. |
- The register <Dd> is encoded in the "D:Vd" field. The permitted values and encoding of <index> depend on <size>:
- | | |
|--------------|--|
| <size> == 8 | <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field. |
| <size> == 16 | <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field. |
| <size> == 32 | <index> is 0 or 1, encoded in the "index_align<3>" field. |
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and the encoding depends on <size>:
- | | |
|--------------|--|
| <size> == 8 | Encoded in the "index_align<0>" field as 0. |
| <size> == 16 | Encoded in the "index_align<0>" field as 0. |
| <size> == 32 | Encoded in the "index_align<1:0>" field as 0b00. |
- Whenever <align> is present, the permitted values and encoding depend on <size>:
- | | |
|--------------|--|
| <size> == 8 | <align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1. |
| <size> == 16 | <align> is 64, meaning 64-bit alignment, encoded in the "index_align<0>" field as 1. |
| <size> == 32 | <align> can be 64 or 128. 64-bit alignment is encoded in the "index_align<1:0>" field as 0b01, and 128-bit alignment is encoded in the "index_align<1:0>" field as 0b10. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d], index] = MemU[address, ebytes];

- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:
- { <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
 Single-spaced registers, encoded in the "type" field as 0b0000.
- { <Dd>, <Dd+2>, <Dd+4>, <Dd+6> }
 Double-spaced registers, encoded in the "type" field as 0b0001.
- The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and is encoded in the "align" field as 0b00. Whenever <align> is present, the permitted values are:
- | | |
|-----|--|
| 64 | 64-bit alignment, encoded in the "align" field as 0b01. |
| 128 | 128-bit alignment, encoded in the "align" field as 0b10. |
| 256 | 256-bit alignment, encoded in the "align" field as 0b11. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for e = 0 to elements-1
        E1em[D[d], e] = MemU[address,ebytes];
        E1em[D[d2],e] = MemU[address+ebytes,ebytes];
        E1em[D[d3],e] = MemU[address+2*ebytes,ebytes];
        E1em[D[d4],e] = MemU[address+3*ebytes,ebytes];
        address = address + 4*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 32;
  
```

F6.1.96 VLDM, VLDMDB, VLDMIA

Load Multiple SIMD&FP registers loads multiple registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the alias VPOP. See [Alias conditions on page F6-3446](#) for details of when each alias is preferred.

A1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

VLDMDB{<c>}{<q>}{.<size>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

VLDM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

VLDMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VLDR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If regs > 16 || (d+regs) > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Increment After variant

Applies when $P == 0 \ \&\& \ U == 1$.

VLDM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>
 VLDMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VLDR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $regs == 0$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If $regs > 16 \ || \ (d+regs) > 32$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	0
1	1	1	0	1	1	0	P	U	D	W	1	Rn	Vd	1	0	1	0	imm8			

Decrement Before variant

Applies when $P == 1 \ \&\& \ U == 0 \ \&\& \ W == 1$.

VLDMDB{<c>}{<q>}{.<size>} <Rn>!, <sreglist>

Increment After variant

Applies when $P == 0 \ \&\& \ U == 1$.

VLDM{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>
 VLDMIA{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VLDR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = TRUE; add = (U == '1'); wback = (W == '1'); d = UInt(Vd:D); n = UInt(Rn);
```

```
imm32 = ZeroExtend(imm8:'00', 32); regs = UInt(imm8);
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If `(d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD and floating-point 64-bit move on page F3-2438](#) for the T32 instruction set, or [Advanced SIMD and floating-point 64-bit move on page F4-2522](#) for the A32 instruction set.

Alias conditions

Alias	is preferred when
VPOP	<code>P == '0' && U == '1' && W == '1' && Rn == '1101'</code>

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.
- <Rn> For encoding A1 and A2: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.
 For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- ! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
- <sreglist> Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.
- <dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            S[d+r] = MemA[address,4]; address = address+4;
        else
            word1 = MemA[address,4]; word2 = MemA[address+4,4]; address = address+8;
            // Combine the word-aligned words in the correct order for current endianness.
            D[d+r] = if BigEndian() then word1:word2 else word2:word1;
    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

F6.1.97 VLDR

Load SIMD&FP register loads a single register from the Advanced SIMD and floating-point register file, using an address from a general-purpose register, with an optional offset.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Literal variant

Applies when Rn == 1111.

VLDR{<c>}{<q>}{.64} <Dd>, <label>
 VLDR{<c>}{<q>}{.64} <Dd>, [PC, #{+/-}<imm>]

Offset variant

Applies when Rn != 1111.

VLDR{<c>}{<q>}{.64} <Dd>, [<Rn> {, #{+/-}<imm>}]

Decode for all variants of this encoding

single_reg = FALSE; add = (U == '1'); imm32 = ZeroExtend(imm8:'00', 32);
 d = UInt(D:Vd); n = UInt(Rn);

A2

Literal variant

Applies when Rn == 1111.

VLDR{<c>}{<q>}{.32} <Sd>, <label>
 VLDR{<c>}{<q>}{.32} <Sd>, [PC, #{+/-}<imm>]

Offset variant

Applies when Rn != 1111.

VLDR{<c>}{<q>}{.32} <Sd>, [<Rn> {, #{+/-}<imm>}]

Decode for all variants of this encoding

single_reg = TRUE; add = (U == '1'); imm32 = ZeroExtend(imm8:'00', 32);
 d = UInt(Vd:D); n = UInt(Rn);

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	0	
1	1	1	0	1	1	0	1	U	D	0	1	Rn	Vd	1	0	1	1	imm8				

Literal variant

Applies when Rn == 1111.

VLDR{<c>}{<q>}{.64} <Dd>, <label>
VLDR{<c>}{<q>}{.64} <Dd>, [PC, #<+/-><imm>]

Offset variant

Applies when Rn != 1111.

VLDR{<c>}{<q>}{.64} <Dd>, [<Rn> {, #<+/-><imm>}]

Decode for all variants of this encoding

single_reg = FALSE; add = (U == '1'); imm32 = ZeroExtend(imm8:'00', 32);
d = UInt(D:Vd); n = UInt(Rn);

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	0	
1	1	1	0	1	1	0	1	U	D	0	1	Rn	Vd	1	0	1	0	imm8				

Literal variant

Applies when Rn == 1111.

VLDR{<c>}{<q>}{.32} <Sd>, <label>
VLDR{<c>}{<q>}{.32} <Sd>, [PC, #<+/-><imm>]

Offset variant

Applies when Rn != 1111.

VLDR{<c>}{<q>}{.32} <Sd>, [<Rn> {, #<+/-><imm>}]

Decode for all variants of this encoding

single_reg = TRUE; add = (U == '1'); imm32 = ZeroExtend(imm8:'00', 32);
d = UInt(Vd:D); n = UInt(Rn);

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- .64 Optional data size specifiers.
- <Dd> The destination register for a doubleword load.
- .32 Optional data size specifiers.
- <Sd> The destination register for a singleword load.

<label>	The label of the literal data item to be loaded. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the instruction to this label. Permitted values are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, <code>imm32</code> is equal to the offset and <code>add == TRUE</code> . If the offset is negative, <code>imm32</code> is equal to minus the offset and <code>add == FALSE</code> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<imm>	The immediate offset used for forming the address. For the immediate forms of the syntax, <imm> can be omitted, in which case the #0 form of the instruction is assembled. Permitted values are multiples of 4 in the range 0 to 1020.

For the literal forms of the instruction, the base register is encoded as `0b1111` to indicate that the PC is the base register.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2359.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    CheckVFPEnabled(TRUE);
    base = if n == 15 then Align(PC,4) else R[n];
    address = if add then (base + imm32) else (base - imm32);
    if single_reg then
        S[d] = MemA[address,4];
    else
        word1 = MemA[address,4]; word2 = MemA[address+4,4];
        // Combine the word-aligned words in the correct order for current endianness.
        D[d] = if BigEndian() then word1:word2 else word2:word1;
```

F6.1.98 VMAX (floating-point)

Vector Maximum compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.

The operand vector elements are 32-bit floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMAX{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMAX{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
maximum = (op == '0'); esize = 32; elements = 2;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMAX{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMAX{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
maximum = (op == '0'); esize = 32; elements = 2;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 . An A32 VMAX or VMIN instruction must be unconditional. ARM strongly recommends that a T32 VMAX or VMIN instruction is unconditional, see Conditional execution on page F2-2397 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point maximum and minimum

- $\max(+0.0, -0.0) = +0.0$
- If any input is a NaN, the corresponding result element is the default NaN.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize]; op2 = Elem[D[m+r],e,esize];
            if maximum then
                Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
            else
                Elem[D[d+r],e,esize] = FPMin(op1, op2, StandardFPSCRValue());
```

F6.1.99 VMAX (integer)

Vector Maximum compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMAX{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
maximum = (op == '0'); unsigned = (U == '1');
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMAX{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
maximum = (op == '0'); unsigned = (U == '1');
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VMAX or VMIN instruction must be unconditional. ARM strongly recommends that a T32 VMAX or VMIN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
- | | |
|-----|-----------------------|
| S8 | when U = 0, size = 00 |
| S16 | when U = 0, size = 01 |
| S32 | when U = 0, size = 10 |
| U8 | when U = 1, size = 00 |
| U16 | when U = 1, size = 01 |
| U32 | when U = 1, size = 10 |
- The following encodings are reserved:
- U = 0, size = 11.
 - U = 1, size = 11.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Int(Elem[D[n+r],e,esize], unsigned);
      op2 = Int(Elem[D[m+r],e,esize], unsigned);
      result = if maximum then Max(op1,op2) else Min(op1,op2);
      Elem[D[d+r],e,esize] = result<esize-1:0>;
  
```

F6.1.100 VMAXNM

This instruction determines the floating-point maximum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point VMAX.

This instruction is not conditional.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMAXNM{<q>}.F32 <Dd>, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMAXNM{<q>}.F32 <Qd>, <Qn>, <Qm>

Decode for all variants of this encoding

```

    else
      S[d] = FMinNum(S[n], S[m], FPSCR);
  
```

F6.1.101 VMIN (floating-point)

Vector Minimum compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.

The operand vector elements are 32-bit floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 1.

VMIN{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
maximum = (op == '0'); esize = 32; elements = 2;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMIN{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMIN{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
maximum = (op == '0'); esize = 32; elements = 2;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VMAX or VMIN instruction must be unconditional. ARM strongly recommends that a T32 VMAX or VMIN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point minimum

- $\min(+0.0, -0.0) = -0.0$
- If any input is a NaN, the corresponding result element is the default NaN.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize]; op2 = Elem[D[m+r],e,esize];
            if maximum then
                Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
            else
                Elem[D[d+r],e,esize] = FPMin(op1, op2, StandardFPSCRValue());
```

F6.1.102 VMIN (integer)

Vector Minimum compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

128-bit SIMD vector variant

Applies when Q == 1.

VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
maximum = (op == '0'); unsigned = (U == '1');
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VMAX or VMIN instruction must be unconditional. ARM strongly recommends that a T32 VMAX or VMIN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
- | | |
|-----|-----------------------|
| S8 | when U = 0, size = 00 |
| S16 | when U = 0, size = 01 |
| S32 | when U = 0, size = 10 |
| U8 | when U = 1, size = 00 |
| U16 | when U = 1, size = 01 |
| U32 | when U = 1, size = 10 |
- The following encodings are reserved:
- U = 0, size = 11.
 - U = 1, size = 11.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Int(Elem[D[n+r],e,esize], unsigned);
      op2 = Int(Elem[D[m+r],e,esize], unsigned);
      result = if maximum then Max(op1,op2) else Min(op1,op2);
      Elem[D[d+r],e,esize] = result<esize-1:0>;
  
```

F6.1.103 VMINNM

This instruction determines the floating point minimum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point VMIN.

This instruction is not conditional.

A1

64-bit SIMD vector variant

Applies when Q == 0.

```

F6.1.106 VMLA (by scalar)

Vector Multiply Accumulate multiplies elements of a vector by a scalar, and adds the products to corresponding elements of the destination vector.

For more information about scalars see [Advanced SIMD scalars on page F2-2421](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMLA{<c>}{<q>}.<type><size> <Dd>, <Dn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 0

128-bit SIMD vector variant

Applies when Q == 1.

VMLA{<c>}{<q>}.<type><size> <Qd>, <Qn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 1

Decode for all variants of this encoding

```

```

F6.1.109 VMLS (floating-point)

Vector Multiply Subtract multiplies corresponding elements in two vectors, subtracts the products from corresponding elements of the destination vector, and places the results in the destination vector.

———— Note ————

ARM recommends that software does not use the VMLS instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

```

F6.1.110 VMLS (integer)

Vector Multiply Subtract multiplies corresponding elements in two vectors, and subtracts the products from the corresponding elements of the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMLS{<c>}{<q>}.<type><size> <Dd>, <Dn>, <Dm> // Encoding T1/A1, encoded as Q = 0

128-bit SIMD vector variant

Applies when Q == 1.

VMLS{<c>}{<q>}.<type><size> <Qd>, <Qn>, <Qm> // Encoding T1/A1, encoded as Q = 1

Decode for all variants of this encoding

```

if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
add = (op == '0'); long_destination = FALSE;
unsigned = FALSE; // "Don't care" value: TRUE produces same functionality
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMLS{<c>}{<q>}.<type><size> <Dd>, <Dn>, <Dm> // Encoding T1/A1, encoded as Q = 0

128-bit SIMD vector variant

Applies when Q == 1.

VMLS{<c>}{<q>}.<type><size> <Qd>, <Qn>, <Qm> // Encoding T1/A1, encoded as Q = 1

Decode for all variants of this encoding

```

if size == '11' then UNDEFINED;

```

F6.1.114 VMOV (between two general-purpose registers and a doubleword floating-point register)

Copy two general-purpose registers to or from a SIMD&FP register copies two words from two general-purpose registers into a doubleword register in the Advanced SIMD and floating-point register file, or from a doubleword register in the Advanced SIMD and floating-point register file to two general-purpose registers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Encoding

Applies when op == 1.

VMOV{<c>}{<q>} <Rt>, <Rt2>, <Dm>

Encoding

Applies when op == 0.

VMOV{<c>}{<q>} <Dm>, <Rt>, <Rt2>

Decode for all variants of this encoding

```
to_arm_registers = (op == '1'); t = UInt(Rt); t2 = UInt(Rt2); m = UInt(M:Vm);
if t == 15 || t2 == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If to_arm_registers && t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

T1

Encoding

Applies when op == 1.

VMOV{<c>}{<q>} <Rt>, <Rt2>, <Dm>

Encoding

Applies when op == 0.

VMOV{<c>}{<q>} <Dm>, <Rt>, <Rt2>

Decode for all variants of this encoding

```
to_arm_registers = (op == '1'); t = UInt(Rt); t2 = UInt(Rt2); m = UInt(M:Vm);  
if t == 15 || t2 == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13  
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `to_arm_registers && t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <Dm> Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "M:Vm" field.
- <Rt2> Is the first general-purpose register that <Dm>[63:32] will be transferred to or from, encoded in the "Rt" field.
- <Rt> Is the first general-purpose register that <Dm>[31:0] will be transferred to or from, encoded in the "Rt" field.
- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations(); CheckVFPEnabled(TRUE);  
  if to_arm_registers then  
    R[t] = D[m]<31:0>;  
    R[t2] = D[m]<63:32>;  
  else  
    D[m]<31:0> = R[t];  
    D[m]<63:32> = R[t2];
```

F6.1.115 VMOV (immediate)

Copy immediate value to a SIMD&FP register places an immediate constant into every element of the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 Advanced SIMD VM0V (immediate) instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VM0V (immediate) instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> The data type. It must be one of I8, I16, I32, I64, or F32.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <imm> For encoding A1 and T1: is a constant of the type specified by <dt> that is replicated to fill the destination register. For details of the range of constants available and the encoding of <dt> and <imm>, see [Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F2-2412](#).
- For encoding A2 and T2: is a signed floating-point constant with 3-bit exponent and normalized 4 bits of precision, encoded in "imm4H:imm4L". For details of the range of constants available and the encoding of <imm>, see [Modified immediate constants in T32 and A32 floating-point instructions on page F2-2413](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDorVFPEabled(TRUE, advsimd);
    if single_register then
        S[d] = imm32;
    else
        for r = 0 to regs-1
            D[d+r] = imm64;
```

F6.1.116 VMOV (register)

Copy between FP registers copies the contents of one FP register to another.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

and is the preferred disassembly when $N:Vn == M:Vm$.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 Advanced SIMD VMOV (register) instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VMOV (register) instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> An optional data type. <dt> must not be F64, but it is otherwise ignored.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

Operation for all encodings

The description of [VORR \(register\)](#) gives the operational pseudocode for this instruction.

F6.1.118 VMOV (general-purpose register to scalar)

Copy a general-purpose register to a vector element copies a byte, halfword, or word from a general-purpose register into an Advanced SIMD scalar.

On a Floating-point-only system, this instruction transfers one word to the upper or lower half of a double-precision floating-point register from a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see [Advanced SIMD scalars on page F2-2421](#).

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

| 32 | Encoded as U = 0, opc1<1> = 0, opc2 = 0b00. [x] is encoded in opc1<0>. |
| omitted | Equivalent to 32. |
- <Rt> The destination general-purpose register.
- <Dn[x]> The scalar. For details of how [x] is encoded see the description of <dt>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDorVFPEEnabled(TRUE, advsimd);
    if unsigned then
        R[t] = ZeroExtend(Elem[D[n],index,esize], 32);
    else
        R[t] = SignExtend(Elem[D[n],index,esize], 32);
```

F6.1.121 VMOV (between two general-purpose registers and two single-precision registers)

Copy two general-purpose registers to a pair of 32-bit SIMD&FP registers transfers the contents of two consecutively numbered single-precision Floating-point registers to two general-purpose registers, or the contents of two general-purpose registers to a pair of single-precision Floating-point registers. The general-purpose registers do not have to be contiguous.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Encoding

Applies when op == 1.

VMOV{<c>}{<q>} <Rt>, <Rt2>, <Sm>, <Sm1>

Encoding

Applies when op == 0.

VMOV{<c>}{<q>} <Sm>, <Sm1>, <Rt>, <Rt2>

Decode for all variants of this encoding

```
to_arm_registers = (op == '1'); t = UInt(Rt); t2 = UInt(Rt2); m = UInt(Vm:M);
if t == 15 || t2 == 15 || m == 31 then UNPREDICTABLE;
if CurrentInstrSet() != InstrSet_A32 && (t == 13 || t2 == 13) then UNPREDICTABLE;
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If to_arm_registers && t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

If m == 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.

T1

Encoding

Applies when `op == 1`.

`VMOV{<c>}{<q>} <Rt>, <Rt2>, <Sm>, <Sm1>`

Encoding

Applies when `op == 0`.

`VMOV{<c>}{<q>} <Sm>, <Sm1>, <Rt>, <Rt2>`

Decode for all variants of this encoding

```
to_arm_registers = (op == '1'); t = UInt(Rt); t2 = UInt(Rt2); m = UInt(Vm:M);
if t == 15 || t2 == 15 || m == 31 then UNPREDICTABLE;
if CurrentInstrSet() != InstrSet_A32 && (t == 13 || t2 == 13) then UNPREDICTABLE;
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `to_arm_registers && t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value in the registers is UNKNOWN.

If `m == 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<code><Rt2></code>	Is the second general-purpose register that <code><Sm1></code> will be transferred to or from, encoded in the "Rt" field.
<code><Rt></code>	Is the first general-purpose register that <code><Sm></code> will be transferred to or from, encoded in the "Rt" field.
<code><Sm1></code>	Is the 32-bit name of the second SIMD&FP register to be transferred. This is the next SIMD&FP register after <code><Sm></code> .
<code><Sm></code>	Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the "Vm:M" field.
<code><c></code>	See Standard assembler syntax fields on page F2-2396 .
<code><q></code>	See Standard assembler syntax fields on page F2-2396 .

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
if to_arm_registers then
```

```
R[t] = S[m];  
R[t2] = S[m+1];  
else  
S[m] = R[t];  
S[m+1] = R[t2];
```

F6.1.122 VMOVL

Vector Move Long takes each element in a doubleword vector, sign or zero-extends them to twice their original length, and places the results in a quadword vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

d = UInt(D:Vd); m = UInt(M:Vm);
  
```

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VMOVL instruction must be unconditional. ARM strongly recommends that a T32 VMOVL instruction is unconditional, see [Conditional execution on page F2-2397](#).

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the operand, encoded in the "U:imm3H" field. It can have the following values:
- | | |
|-----|-------------------------|
| S8 | when U = 0, imm3H = 001 |
| S16 | when U = 0, imm3H = 010 |
| S32 | when U = 0, imm3H = 100 |
| U8 | when U = 1, imm3H = 001 |
| U16 | when U = 1, imm3H = 010 |
| U32 | when U = 1, imm3H = 100 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        result = Int(Elem[Din[m],e,esize], unsigned);
        Elem[Q[d>1],e,2*esize] = result<2*esize-1:0>;
```

F6.1.123 VMOVN

Vector Move and Narrow copies the least significant half of each element of a quadword vector into the corresponding elements of a doubleword vector.

The operand vector elements can be any one of 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the aliases VRSHRN (zero) and VSHRN (zero). See [Alias conditions on page F6-3510](#) for details of when each alias is preferred.

VSHRN (zero)	Never

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VMOVN instruction must be unconditional. ARM strongly recommends that a T32 VMOVN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:
- | | |
|-----|----------------|
| I16 | when size = 00 |
| I32 | when size = 01 |
| I64 | when size = 10 |
- The encoding size = 11 is reserved.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        Elem[D[d],e,esize] = Elem[Qin[m>1],e,2*esize]<esize-1:0>;
  
```

F6.1.124 VMRS

Move SIMD&FP Special register to general-purpose register moves the value of an Advanced SIMD and floating-point System register to a general-purpose register. When the specified System register is the **FPSCR**, a form of the instruction transfers the **FPSCR**.{N, Z, C, V} condition flags to the *The Application Program Status Register*; *APSR* on page E1-2289. {N, Z, C, V} condition flags.

Depending on settings in the **CPACR**, **NSACR**, **HCPTR**, and **FPEXC** registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3865.

When these settings permit the execution of floating-point and Advanced SIMD instructions, if the specified floating-point System register is not the **FPSCR**, the instruction is UNDEFINED if executed in User mode.

In an implementation that includes EL2, when **HCR.TID0** is set to 1, any **VMRS** access to **FPSID** from a Non-secure EL1 mode that would be permitted if **HCR.TID0** was set to 0 generates a Hyp Trap exception. For more information, see *ID group 0, Primary device identification registers* on page G1-3886.

For simplicity, the **VMRS** pseudocode does not show the possible trap to Hyp mode.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	2	1	0

VMRS{<c>}{<q>} <Rt>, <spec_reg>

Decode for this encoding

```
t = UInt(Rt);
if !(reg IN {'000x', '0101', '011x', '1000'}) then UNPREDICTABLE;
if t == 15 && reg != '0001' then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If !(reg IN {'000x', '0101', '011x', '1000'}), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction transfers an UNKNOWN value to the specified target register. When the **Rt** field holds the value **0b1111**, the specified target register is the **APSR**.{N, Z, C, V} bits, and these bits become UNKNOWN. Otherwise, the specified target register is the register specified by the **Rt** field, **R0** - **R14**.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	2	1	0

    when '1000' R[t] = FPEXC;
    otherwise Unreachable(); // Dealt with above or in encoding-specific pseudocode
```

F6.1.125 VMSR

Move general-purpose register to SIMD&FP Special register moves the value of a general-purpose register to a floating-point System register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

When these settings permit the execution of floating-point and Advanced SIMD instructions:

- If the specified floating-point System register is not the FPSCR, the instruction is UNDEFINED if executed in User mode.
- If the specified floating-point System register is the FPEXC and the instruction is executed in a mode other than User mode the instruction is ignored.

        Elem[Q[d>1],e,2*esize] = product;
      else
        Elem[D[d+r],e,esize] = product<esize-1:0>;
  
```

F6.1.128 VMUL (by scalar)

Vector Multiply multiplies each element in a vector by a scalar, and places the results in a second vector.

For more information about scalars see [Advanced SIMD scalars on page F2-2421](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

64-bit SIMD vector variant

Applies when Q == 0.

VMVN{<c>}{<q>}{. <dt>} <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMVN{<c>}{<q>}{. <dt>} <Qd>, <Qm>

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VMVN instruction must be unconditional. ARM strongly recommends that a T32 VMVN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = NOT(D[m+r]);
```

F6.1.133 VNEG

Vector Negate negates each element in a vector, and places the results in a second vector. The floating-point version only inverts the sign bit.

Depending on settings in the CPACR, NSACR, HCPTR, and FPExc registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

    if dp_operation then
      D[d] = FPNeg(D[m]);
    else
      S[d] = FPNeg(S[m]);
  
```

F6.1.134 VNMLA

Vector Negate Multiply Accumulate multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the negation of the product, and writes the result back to the destination register.

———— Note —————

ARM recommends that software does not use the VNMLA instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

F6.1.137 VORN (immediate)

Vector Bitwise OR NOT (immediate) performs a bitwise OR between a register value and the complement of an immediate value, and returns the result into the destination vector

This instruction is an alias of the [VORR \(immediate\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VORR \(immediate\)](#).
- The description of [VORR \(immediate\)](#) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VORN{<c>}{<q>}.<dt> {<Dd>}, <Dd>, #<imm>

is equivalent to

VORR{<c>}{<q>}.<dt> <Dd>, #~<imm>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VORN{<c>}{<q>}.<dt> {<Qd>}, <Qd>, #<imm>

is equivalent to

VORR{<c>}{<q>}.<dt> <Qd>, #~<imm>

and is never the preferred disassembly.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VORR instruction must be unconditional. ARM strongly recommends that a T32 VORR instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> The data type used for <imm>. It can be either I16 or I32. I8, I64, and F32 are also permitted, but the resulting syntax is a pseudo-instruction.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <imm> Is a constant of the type specified by <dt> that is replicated to fill the destination register. For details of the range of constants available and the encoding of <dt> and <imm>, see [Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F2-2412](#).

Operation for all encodings

The description of [VORR \(immediate\)](#) gives the operational pseudocode for this instruction.

F6.1.138 VORN (register)

Vector bitwise OR NOT (register) performs a bitwise OR NOT operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Applies when Q == 1.

VORN{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
 d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VORN instruction must be unconditional. ARM strongly recommends that a T32 VORN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR NOT(D[m+r]);
```

F6.1.139 VORR (immediate)

Vector Bitwise OR (immediate) performs a bitwise OR between a register value and an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the alias VORN (immediate). See [Alias conditions on page F6-3545](#) for details of when each alias is preferred.

```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-2450 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-2537 for the A32 instruction set.

Alias conditions

Alias	is preferred when
VORN (immediate)	Never

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F2-2396. An A32 VORR instruction must be unconditional. ARM strongly recommends that a T32 VORR instruction is unconditional, see *Conditional execution* on page F2-2397.
- <q> See *Standard assembler syntax fields* on page F2-2396.
- <dt> The data type used for <imm>. It can be either I16 or I32. I8, I64, and F32 are also permitted, but the resulting syntax is a pseudo-instruction.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <imm> Is a constant of the type specified by <dt> that is replicated to fill the destination register. For details of the range of constants available and the encoding of <dt> and <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-2412.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[d+r] OR imm64;
  
```

F6.1.140 VORR (register)

Vector bitwise OR (register) performs a bitwise OR operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the aliases VMOV (register, SIMD), VRSHR (zero), and VSHR (zero). See [Alias conditions on page F6-3547](#) for details of when each alias is preferred.

    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR D[m+r];
  
```

F6.1.141 VPADAL

Vector Pairwise Add and Accumulate Long adds adjacent pairs of elements of a vector, and accumulates the results into the elements of the destination vector.

The vectors can be doubleword or quadword. The operand elements can be 8-bit, 16-bit, or 32-bit integers. The result elements are twice the length of the operand elements.

The following figure shows an example of the operation of VPADAL doubleword operation for data type S16.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-3865*.

- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  h = elements DIV 2;

  for r = 0 to regs-1
    for e = 0 to h-1
      op1 = Elem[D[m+r],2*e,esize]; op2 = Elem[D[m+r],2*e+1,esize];
      result = Int(op1, unsigned) + Int(op2, unsigned);
      Elem[D[d+r],e,2*esize] = Elem[D[d+r],e,2*esize] + result;
```

F6.1.142 VPADD (floating-point)

Vector Pairwise Add (floating-point) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements are 32-bit floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  h = elements DIV 2;

  for r = 0 to regs-1
    for e = 0 to h-1
      op1 = Elem[D[m+r],2*e,esize]; op2 = Elem[D[m+r],2*e+1,esize];
      result = Int(op1, unsigned) + Int(op2, unsigned);
      Elem[D[d+r],e,2*esize] = result<2*esize-1:0>;
```

F6.1.145 VPMAX (floating-point)

Vector Pairwise Maximum compares adjacent pairs of elements in two doubleword vectors, and copies the larger of each pair into the corresponding element in the destination doubleword vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

A1 variant

VPMAX{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

Decode for this encoding

```
if sz == '1' || Q == '1' then UNDEFINED;
maximum = (op == '0'); esize = 32; elements = 2;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

T1

T1 variant

VPMAX{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>

Decode for this encoding

```
if sz == '1' || Q == '1' then UNDEFINED;
maximum = (op == '0'); esize = 32; elements = 2;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VPMAX or VPMIN instruction must be unconditional. ARM strongly recommends that a T32 VPMAX or VPMIN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(64) dest;
```

```
h = elements DIV 2;

for e = 0 to h-1
    op1 = Elem[D[n],2*e,esize]; op2 = Elem[D[n],2*e+1,esize];
    Elem[dest,e,esize] = if maximum then FPMax(op1,op2,StandardFPSCRValue()) else
FPMin(op1,op2,StandardFPSCRValue());
    op1 = Elem[D[m],2*e,esize]; op2 = Elem[D[m],2*e+1,esize];
    Elem[dest,e+h,esize] = if maximum then FPMax(op1,op2,StandardFPSCRValue()) else
FPMin(op1,op2,StandardFPSCRValue());

D[d] = dest;
```

F6.1.146 VPMAX (integer)

Vector Pairwise Maximum compares adjacent pairs of elements in two doubleword vectors, and copies the larger of each pair into the corresponding element in the destination doubleword vector.

The following figure shows an example of the operation of VPMAX doubleword operation for data type S16 or U16.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3865.

        Elem[dest,e+h,esize] = result<esize-1:0>;

D[d] = dest;
```

F6.1.149 VPOP

Pop SIMD&FP registers from Stack loads multiple consecutive Advanced SIMD and floating-point register file registers from the stack

This instruction is an alias of the [VLDM](#), [VLDMDB](#), [VLDMIA](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VLDM](#), [VLDMDB](#), [VLDMIA](#).
- The description of [VLDM](#), [VLDMDB](#), [VLDMIA](#) gives the operational pseudocode for this instruction.

A1

Increment After variant

VPOP{<c>}{<q>}{.<size>} <dreglist>

is equivalent to

VLDM{<c>}{<q>}{.<size>} SP!, <dreglist>

and is always the preferred disassembly.

A2

Increment After variant

VPOP{<c>}{<q>}{.<size>} <sreglist>

is equivalent to

VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>

and is always the preferred disassembly.

T1

Increment After variant

VPOP{<c>}{<q>}{.<size>} <dreglist>

is equivalent to

VLDM{<c>}{<q>}{.<size>} SP!, <dreglist>

and is always the preferred disassembly.

T2

Increment After variant

VPOP{<c>}{<q>}{.<size>} <sreglist>

is equivalent to

VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>

and is always the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<size> An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.

<sreglist> Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

The description of [VLDM](#), [VLDMDB](#), [VLDMIA](#) gives the operational pseudocode for this instruction.

F6.1.150 VPUSH

Push SIMD&FP registers to Stack stores multiple consecutive registers from the Advanced SIMD and floating-point register file to the stack

This instruction is an alias of the [VSTM](#), [VSTMDB](#), [VSTMIA](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VSTM](#), [VSTMDB](#), [VSTMIA](#).
- The description of [VSTM](#), [VSTMDB](#), [VSTMIA](#) gives the operational pseudocode for this instruction.

<size> An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.

<sreglist> Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

The description of [VSTM](#), [VSTMDB](#), [VSTMIA](#) gives the operational pseudocode for this instruction.

F6.1.151 VQABS

Vector Saturating Absolute takes the absolute value of each element in a vector, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, `FPSCR.QC`, is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-2283](#).

Depending on settings in the `CPACR`, `NSACR`, and `HCPTR` registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be `UNDEFINED`, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VQADD instruction must be unconditional. ARM strongly recommends that a T32 VQADD instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the vectors, encoded in the "U:size" field. It can have the following values:
- | | |
|-----|-----------------------|
| S8 | when U = 0, size = 00 |
| S16 | when U = 0, size = 01 |
| S32 | when U = 0, size = 10 |
| S64 | when U = 0, size = 11 |
| U8 | when U = 1, size = 00 |
| U16 | when U = 1, size = 01 |
| U32 | when U = 1, size = 10 |
| U64 | when U = 1, size = 11 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            sum = Int(Elem[D[n+r],e,esize], unsigned) + Int(Elem[D[m+r],e,esize], unsigned);
            (Elem[D[d+r],e,esize], sat) = SatQ(sum, esize, unsigned);
            if sat then FPSR.QC = '1';
  
```

F6.1.153 VQDMLAL

Vector Saturating Doubling Multiply Accumulate Long multiplies corresponding elements in two doubleword vectors, doubles the products, and accumulates the results into the elements of a quadword vector.

The second operand can be a scalar instead of a vector. For more information about scalars see *Advanced SIMD scalars* on page F2-2421.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-2283.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3865.

- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm[x]> The scalar for a scalar operation. If <dt> is S16, Dm is restricted to D0-D7. If <dt> is S32, Dm is restricted to D0-D15.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    if scalar_form then op2 = SInt(Elem[Din[m],index,esize]);
    for e = 0 to elements-1
        if !scalar_form then op2 = SInt(Elem[Din[m],e,esize]);
        op1 = SInt(Elem[Din[n],e,esize]);
        // The following only saturates if both op1 and op2 equal -(2^(esize-1))
        (product, sat) = SignedSatQ(2*op1*op2, 2*esize);
        Elem[Q[d>>1],e,2*esize] = product;
        if sat then FPSR.QC = '1';
```

F6.1.157 VQMOVN, VQMOVUN

Vector Saturating Move and Narrow copies each element of the operand vector to the corresponding element of the destination vector.

The operand is a quadword vector. The elements can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result is a doubleword vector. The elements are half the length of the operand vector elements. If the operand is unsigned, the results are unsigned. If the operand is signed, the results can be signed or unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, `FPSCR.QC`, is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-2283](#).

Depending on settings in the `CPACR`, `NSACR`, and `HCPTR` registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the aliases `VQRSHRN (zero)`, `VQRSHRUN (zero)`, `VQSHRN (zero)`, and `VQSHRUN (zero)`. See [Alias conditions on page F6-3585](#) for details of when each alias is preferred.

```

Alias conditions

Alias	is preferred when
VQRSHRN (zero)	Never
VQRSHRUN (zero)	Never
VQSHRN (zero)	Never
VQSHRUN (zero)	Never

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VQMOVN or VQMOVUN instruction must be unconditional. ARM strongly recommends that a T32 VQMOVN or VQMOVUN instruction is unconditional, see [Conditional execution on page F2-2397](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<dt> For the signed result variant: is the data type for the elements of the operand, encoded in the "op<0>:size" field. It can have the following values:

S16	when op<0> = 0, size = 00
S32	when op<0> = 0, size = 01
S64	when op<0> = 0, size = 10
U16	when op<0> = 1, size = 00
U32	when op<0> = 1, size = 01
U64	when op<0> = 1, size = 10

The following encodings are reserved:

- op<0> = 0, size = 11.
- op<0> = 1, size = 11.

For the unsigned result variant: is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

S16	when size = 00
S32	when size = 01
S64	when size = 10

The encoding size = 11 is reserved.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        operand = Int(Elem[Qin[m>>1],e,2*esize], src_unsigned);
        (Elem[D[d],e,esize], sat) = SatQ(operand, esize, dest_unsigned);
        if sat then FPSR.QC = '1';
```

F6.1.158 VQNEG

Vector Saturating Negate negates each element in a vector, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, `FPSCR.QC`, is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-2283](#).

Depending on settings in the `CPACR`, `NSACR`, and `HCPTR` registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-2444](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-2531](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VQRDMULH instruction must be unconditional. ARM strongly recommends that a T32 VQRDMULH instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
- S16 when size = 01
 S32 when size = 10
- The following encodings are reserved:
- size = 00.
 - size = 11.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm[x]> The scalar for either a quadword or a doubleword scalar operation. If <dt> is S16, Dm is restricted to D0-D7. If <dt> is S32, Dm is restricted to D0-D15.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    round_const = 1 << (esize-1);
    if scalar_form then op2 = SInt(Elem[D[m],index,esize]);
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = SInt(Elem[D[n+r],e,esize]);
            if !scalar_form then op2 = SInt(Elem[D[m+r],e,esize]);
            (result, sat) = SignedSatQ((2*op1*op2 + round_const) >> esize, esize);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSR.QC = '1';
  
```

F6.1.160 VQRSHL

Vector Saturating Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

For truncated results see [VQSHL \(register\)](#).

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, [FPSCR.QC](#), is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-2283](#).

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      shift = SInt(Elem[D[n+r],e,esize]<7:0>);
      round_const = 1 << (-1-shift); // 0 for left shift, 2^(n-1) for right shift
      operand = Int(Elem[D[m+r],e,esize], unsigned);
      (result, sat) = SatQ((operand + round_const) << shift, esize, unsigned);
      Elem[D[d+r],e,esize] = result;
      if sat then FPSR.QC = '1';
```

F6.1.161 VQRSHRN (zero)

Vector Saturating Rounding Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the signed rounded results in a doubleword vector

This instruction is an alias of the [VQMOVN](#), [VQMOVUN](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VQMOVN](#), [VQMOVUN](#).
- The description of [VQMOVN](#), [VQMOVUN](#) gives the operational pseudocode for this instruction.

A1

Signed result variant

VQRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

T1

Signed result variant

VQRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VQMOVN or VQMOVUN instruction must be unconditional. ARM strongly recommends that a T32 VQMOVN or VQMOVUN instruction is unconditional, see [Conditional execution on page F2-2397](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<dt> Is the data type for the elements of the operand, encoded in the "op<0>:size" field. It can have the following values:

S16	when op<0> = 0, size = 00
S32	when op<0> = 0, size = 01
S64	when op<0> = 0, size = 10
U16	when op<0> = 1, size = 00
U32	when op<0> = 1, size = 01

U64 when $op<0> = 1$, size = 10

The following encodings are reserved:

- $op<0> = 0$, size = 11.
- $op<0> = 1$, size = 11.

$<Dd>$ Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

$<Qm>$ Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as $<Qm>*2$.

Operation for all encodings

The description of [VQMOVN](#), [VQMOVUN](#) gives the operational pseudocode for this instruction.

F6.1.162 VQRSHRN, VQRSHRUN

Vector Saturating Rounding Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the rounded results in a doubleword vector.

For truncated results, see [VQSHL \(register\)](#).

The operand elements must all be the same size, and can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result elements are half the width of the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, [FPSCR.QC](#), is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-2283](#).

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VQRSHRN or VQRSHRUN instruction must be unconditional. ARM strongly recommends that a T32 VQRSHRN or VQRSHRUN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <type> For the signed result variant: is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:
 - S when U = 0
 - U when U = 1
 For the unsigned result variant: is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:
 - S when U = 1
- <size> Is the data size for the elements of the vectors, encoded in the "imm6<5:3>" field. It can have the following values:
 - 16 when imm6<5:3> = 001
 - 32 when imm6<5:3> = 01x
 - 64 when imm6<5:3> = 1xx
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <imm> Is an immediate value, in the range 1 to <size>/2, encoded in the "imm6" field as <size>/2 - <imm>.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  round_const = 1 << (shift_amount - 1);
  for e = 0 to elements-1
    operand = Int(Elem[Qin[m>>1],e,2*esize], src_unsigned);
  
```

```
(result, sat) = SatQ((operand + round_const) >> shift_amount, esize, dest_unsigned);  
Elem[D[d],e,esize] = result;  
if sat then FPSR.QC = '1';
```

F6.1.163 VQRSHRUN (zero)

Vector Saturating Rounding Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the unsigned rounded results in a doubleword vector

This instruction is an alias of the [VQMOVN](#), [VQMOVUN](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VQMOVN](#), [VQMOVUN](#).
- The description of [VQMOVN](#), [VQMOVUN](#) gives the operational pseudocode for this instruction.

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VQSHL or VQSHLU instruction must be unconditional. ARM strongly recommends that a T32 VQSHL or VQSHLU instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <type> Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:

S	when U = 0
U	when U = 1

<size>	Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values: 8 when L = 0, imm6<5:3> = 001 16 when L = 0, imm6<5:3> = 01x 32 when L = 0, imm6<5:3> = 1xx 64 when L = 1, imm6<5:3> = xxx
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qm>	Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
<imm>	Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            operand = Int(Elem[D[m+r],e,esize], src_unsigned);
            (result, sat) = SatQ(operand << shift_amount, esize, dest_unsigned);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSR.QC = '1';
```

F6.1.165 VQSHL (register)

Vector Saturating Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

The results are truncated. For rounded results, see [VQRSHL](#).

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, [FPSCR.QC](#), is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-2283](#).

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

- $op<0> = 1$, size = 11.

$<Dd>$ Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

$<Qm>$ Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as $<Qm>*2$.

Operation for all encodings

The description of [VQMOVN](#), [VQMOVUN](#) gives the operational pseudocode for this instruction.

F6.1.167 VQSHRN, VQSHRUN

Vector Saturating Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the truncated results in a doubleword vector.

For rounded results, see [VQRSHRN](#), [VQRSHRUN](#).

The operand elements must all be the same size, and can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result elements are half the width of the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, [FPSCR.QC](#), is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-2283](#).

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VQSHRN or VQSHRUN instruction must be unconditional. ARM strongly recommends that a T32 VQSHRN or VQSHRUN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <type> For the signed result variant: is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:
 - S when U = 0
 - U when U = 1
 For the unsigned result variant: is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:
 - S when U = 1
- <size> Is the data size for the elements of the vectors, encoded in the "imm6<5:3>" field. It can have the following values:
 - 16 when imm6<5:3> = 001
 - 32 when imm6<5:3> = 01x
 - 64 when imm6<5:3> = 1xx
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <imm> Is an immediate value, in the range 1 to <size>/2, encoded in the "imm6" field as <size>/2 - <imm>.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for e = 0 to elements-1
  operand = Int(Elem[Qin[m>>1],e,2*esize], src_unsigned);
  
```

```
(result, sat) = SatQ(operand >> shift_amount, esize, dest_unsigned);  
Elem[D[d],e,esize] = result;  
if sat then FPSR.QC = '1';
```

F6.1.168 VQSHRUN (zero)

Vector Saturating Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the unsigned truncated results in a doubleword vector.

This instruction is an alias of the [VQMOVN](#), [VQMOVUN](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VQMOVN](#), [VQMOVUN](#).
- The description of [VQMOVN](#), [VQMOVUN](#) gives the operational pseudocode for this instruction.

op

Unsigned result variant

VQSHRUN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VQMOVUN{<c>}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VQMOVN or VQMOVUN instruction must be unconditional. ARM strongly recommends that a T32 VQMOVN or VQMOVUN instruction is unconditional, see [Conditional execution on page F2-2397](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<dt> Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

S16 when size = 00

S32 when size = 01

S64 when size = 10

The encoding size = 11 is reserved.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

The description of [VQMOVN](#), [VQMOVUN](#) gives the operational pseudocode for this instruction.

F6.1.169 VQSUB

Vector Saturating Subtract subtracts the elements of the second operand vector from the corresponding elements of the first operand vector, and places the results in the destination vector. Signed and unsigned operations are distinct.

The operand and result elements must all be the same type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

If any of the results overflow, they are saturated. The cumulative saturation bit, `FPSCR.QC`, is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-2283](#).

Depending on settings in the `CPACR`, `NSACR`, and `HCPTTR` registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be `UNDEFINED`, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VQSUB instruction must be unconditional. ARM strongly recommends that a T32 VQSUB instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the vectors, encoded in the "U:size" field. It can have the following values:
 - S8 when U = 0, size = 00
 - S16 when U = 0, size = 01
 - S32 when U = 0, size = 10
 - S64 when U = 0, size = 11
 - U8 when U = 1, size = 00
 - U16 when U = 1, size = 01
 - U32 when U = 1, size = 10
 - U64 when U = 1, size = 11
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      diff = Int(Elem[D[n+r],e,esize], unsigned) - Int(Elem[D[m+r],e,esize], unsigned);
      (Elem[D[d+r],e,esize], sat) = SatQ(diff, esize, unsigned);
      if sat then FPSR.QC = '1';
```

F6.1.170 VRADDHN

Vector Rounding Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are rounded. For truncated results, see [VADDHN](#).

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

A1 variant

if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-2444](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-2531](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VRADDHN instruction must be unconditional. ARM strongly recommends that a T32 VRADDHN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).

- <dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
- I16 when size = 00
 - I32 when size = 01
 - I64 when size = 10
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    round_const = 1 << (esize-1);
    for e = 0 to elements-1
        result = Elem[Qin[n>>1],e,2*esize] + Elem[Qin[m>>1],e,2*esize] + round_const;
        Elem[D[d],e,esize] = result<2*esize-1:esize>;
```

F6.1.171 VRECPE

Vector Reciprocal Estimate finds an approximate reciprocal of each element in the operand vector, and places the results in the destination vector.

The operand and result elements are the same type, and can be 32-bit floating-point numbers, or 32-bit unsigned integers.

For details of the operation performed by this instruction see [Floating-point reciprocal square root estimate and step on page E1-2300](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

F6.1.173 VREV16

Vector Reverse in halfwords reverses the order of 8-bit elements in each halfword of the vector, and places the result in the corresponding destination vector.

There is no distinction between data types, other than size.

The following figure shows an example of the operation of VREV16 doubleword operation.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VREV16{<c>}{<q>}.<dt> <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VREV16{<c>}{<q>}.<dt> <Qd>, <Qm>

Decode for all variants of this encoding

```

if UInt(op)+UInt(size) >= 3 then UNDEFINED;

        D[d+r] = result;
```

F6.1.176 VRHADD

Vector Rounding Halving Add adds corresponding elements in two vectors of integers, shifts each result right one bit, and places the final results in the destination vector.

The operand and result elements are all the same type, and can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The results of the halving operations are rounded. For truncated results, see [VHADD](#).

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Assembler symbols

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckAdvSIMDEnabled();  
for r = 0 to regs-1  
  for e = 0 to elements-1  
    op1 = Elem[D[m+r],e,esize];  
    result = FPRoundInt(op1, StandardFPSCRValue(), rounding, exact);  
    Elem[D[d+r],e,esize] = result;
```

F6.1.180 VRINTM (floating-point)

Round floating-point to integer towards -Infinity rounds a floating-point value to an integral floating-point value of the same size using the Round towards -Infinity rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

Single-precision scalar variant

Applies when `sz == 0`.

VRINTM{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when `sz == 1`.

VRINTM{<q>}.F64 <Dd>, <Dm>

Decode for all variants of this encoding

```
rounding = FPDecodeRM(RM); exact = FALSE; dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
if InITBlock() then UNPREDICTABLE;
```

T1

Single-precision scalar variant

Applies when `sz == 0`.

VRINTM{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when `sz == 1`.

VRINTM{<q>}.F64 <Dd>, <Dm>

Decode for all variants of this encoding

```
rounding = FPDecodeRM(RM); exact = FALSE; dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckVFPEnabled(TRUE);  
if dp_operation then  
    D[d] = FPRoundInt(D[m], FPSCR, rounding, exact);  
else  
    S[d] = FPRoundInt(S[m], FPSCR, rounding, exact);
```

F6.1.181 VRINTN (Advanced SIMD)

Vector Round floating-point to integer to Nearest rounds a vector of floating-point values to integral floating-point values of the same size using the Round to Nearest rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VRINTN{<q>}.F32 <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VRINTN{<q>}.F32 <Qd>, <Qm>

Decode for all variants of this encoding

```

if op<2> != op<0> then SEE "Related encodings";

for r = 0 to regs-1
  for e = 0 to elements-1
    op1 = Elem[D[m+r],e,esize];
    result = FPRoundInt(op1, StandardFPCRValue(), rounding, exact);
    Elem[D[d+r],e,esize] = result;
```

F6.1.189 VRINTZ (floating-point)

Round floating-point to integer towards Zero rounds a floating-point value to an integral floating-point value of the same size, using the Round towards Zero rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

Single-precision scalar variant

Applies when `sz == 0`.

VRINTZ{<c>}{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when `sz == 1`.

VRINTZ{<c>}{<q>}.F64 <Dd>, <Dm>

Decode for all variants of this encoding

```

rounding = if op == '1' then FPRounding_ZERO else FPRoundingMode(FPSCR);
dp_operation = (sz == '1'); exact = FALSE;
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
    
```

T1

Single-precision scalar variant

Applies when `sz == 0`.

VRINTZ{<c>}{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when `sz == 1`.

VRINTZ{<c>}{<q>}.F64 <Dd>, <Dm>

Decode for all variants of this encoding

```

rounding = if op == '1' then FPRounding_ZERO else FPRoundingMode(FPSCR);
dp_operation = (sz == '1'); exact = FALSE;
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
    
```

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    if dp_operation then
        D[d] = FPRoundInt(D[m], FPSCR, rounding, exact);
    else
        S[d] = FPRoundInt(S[m], FPSCR, rounding, exact);
```

F6.1.190 VRSHL

Vector Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see VSHL.

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is always a signed integer of the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VRSQRTE instruction must be unconditional. ARM strongly recommends that a T32 VRSQRTE instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the vectors, encoded in the "F:size" field. It can have the following values:
- | | |
|-----|-----------------------|
| U32 | when F = 0, size = 10 |
| F32 | when F = 1, size = 10 |
- The following encodings are reserved:
- F = 0, size = 0x.
 - F = 0, size = 11.
 - F = 1, size = 0x.
 - F = 1, size = 11.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Newton-Raphson iteration

For details of the operation performed and how it can be used in a Newton-Raphson iteration to calculate the reciprocal of the square root of a number, see [Floating-point reciprocal estimate and step on page E1-2299](#).

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      if floating_point then
        Elem[D[d+r],e,32] = FPRsqrtEstimate(Elem[D[m+r],e,32], StandardFPSCRValue());
      else
        Elem[D[d+r],e,32] = UnsignedRSqrtEstimate(Elem[D[m+r],e,32]);
```

F6.1.196 VRSQRTS

Vector Reciprocal Square Root Step multiplies the elements of one vector by the corresponding elements of another vector, subtracts each of the products from 3.0, divides these results by 2.0, and places the results into the elements of the destination vector.

The operand and result elements are 32-bit floating-point numbers.

For details of the operation performed by this instruction see [Floating-point reciprocal estimate and step on page E1-2299](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VRSRA instruction must be unconditional. ARM strongly recommends that a T32 VRSRA instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <type> Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:
 - S when U = 0
 - U when U = 1
- <size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:
 - 8 when L = 0, imm6<5:3> = 001
 - 16 when L = 0, imm6<5:3> = 01x
 - 32 when L = 0, imm6<5:3> = 1xx
 - 64 when L = 1, imm6<5:3> = xxx
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
- <imm> Is an immediate value, in the range 1 to <size>, encoded in the "imm6" field as <size> - <imm>.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  round_const = 1 << (shift_amount - 1);
  for r = 0 to regs-1
    for e = 0 to elements-1
      result = (Int(Elem[D[m+r],e,esize], unsigned) + round_const) >> shift_amount;
      Elem[D[d+r],e,esize] = Elem[D[d+r],e,esize] + result;
  
```

F6.1.198 VRSUBHN

Vector Rounding Subtract and Narrow, returning High Half subtracts the elements of one quadword vector from the corresponding elements of another quadword vector, takes the most significant half of each result, and places the final results in a doubleword vector. The results are rounded. For truncated results, see [VSUBHN](#).

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VSHL instruction must be unconditional. ARM strongly recommends that a T32 VSHL instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

8	when L = 0, imm6<5:3> = 001
16	when L = 0, imm6<5:3> = 01x
32	when L = 0, imm6<5:3> = 1xx
64	when L = 1, imm6<5:3> = xxx
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
- <imm> Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      Elem[D[d+r],e,esize] = LSL(Elem[D[m+r],e,esize], shift_amount);
  
```

F6.1.201 VSHL (register)

Vector Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift.

For a rounding shift, see [VRSHL](#).

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is always a signed integer of the same size.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      shift = SInt(Elem[D[n+r],e,esize]<7:0>);
      result = Int(Elem[D[m+r],e,esize], unsigned) << shift;
      Elem[D[d+r],e,esize] = result<esize-1:0>;
  
```

F6.1.202 VSHLL

Vector Shift Left Long takes each element in a doubleword vector, left shifts them by an immediate value, and places the results in a quadword vector.

The operand elements can be:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.
- 8-bit, 16-bit, or 32-bit untyped integers, maximum shift only.

The result elements are twice the length of the operand elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VSHLL instruction must be unconditional. ARM strongly recommends that a T32 VSHLL instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <type> The data type for the elements of the operand. It must be one of:
 - S Signed. In encoding T1/A1, encoded as U = 0.
 - U Unsigned. In encoding T1/A1, encoded as U = 1.
 - I Untyped integer, Available only in encoding T2/A2.

<size> The data size for the elements of the operand. The following table shows the permitted values and their encodings:

<size>	Encoding T1/A1	Encoding T2/A2
8	Encoded as imm6<5:3> = 0b001	Encoded as size = 0b00
16	Encoded as imm6<5:4> = 0b01	Encoded as size = 0b01
32	Encoded as imm6<5> = 1	Encoded as size = 0b10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> The immediate value. <imm> must lie in the range 1 to <size>, and:

- If <size> == <imm>, the encoding is T2/A2.
- Otherwise, the encoding is T1/A1, and:
 - If <size> == 8, <imm> is encoded in imm6<2:0>.
 - If <size> == 16, <imm> is encoded in imm6<3:0>.
 - If <size> == 32, <imm> is encoded in imm6<4:0>.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for e = 0 to elements-1
    result = Int(Elem[Din[m],e,esize], unsigned) << shift_amount;
    Elem[Q[d>1],e,2*esize] = result<2*esize-1:0>;
  
```

F6.1.203 VSHR

Vector Shift Right takes each element in a vector, right shifts them by an immediate value, and places the truncated results in the destination vector. For rounded results, see [VRSHR](#).

The operand and result elements must be the same size, and can be any one of:

    when '1xxxxx' esize = 32; elements = 2; shift_amount = 64 - UInt(imm6);
d = UInt(D:Vd); m = UInt(M:Vm);
    
```

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-2450](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-2537](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VSHRN instruction must be unconditional. ARM strongly recommends that a T32 VSHRN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size for the elements of the vectors, encoded in the "imm6<5:3>" field. It can have the following values:
- | | |
|----|----------------------|
| 16 | when imm6<5:3> = 001 |
| 32 | when imm6<5:3> = 01x |
| 64 | when imm6<5:3> = 1xx |
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <imm> Is an immediate value, in the range 1 to <size>/2, encoded in the "imm6" field as <size>/2 - <imm>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        result = LSR(Elem[Qin[m>>1],e,2*esize], shift_amount);
        Elem[D[d],e,esize] = result<esize-1:0>;
```

F6.1.206 VSHRN (zero)

Vector Shift Right Narrow takes each element in a vector, right shifts them by an immediate value, and places the truncated results in the destination vector

This instruction is an alias of the [VMOVN](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VMOVN](#).
- The description of [VMOVN](#) gives the operational pseudocode for this instruction.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	1	D	1	1	size	1	0	Vd	0	0	1	0	0	0	M	0	Vm			

A1 variant

VSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	10	9	8	7	6	5	4	3	0

T1 variant

VSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VMOVN instruction must be unconditional. ARM strongly recommends that a T32 VMOVN instruction is unconditional, see [Conditional execution on page F2-2397](#).

<q> See [Standard assembler syntax fields on page F2-2396](#).

<dt> Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

I16 when size = 00

I32 when size = 01

I64 when size = 10

The encoding size = 11 is reserved.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

The description of [VMOVN](#) gives the operational pseudocode for this instruction.

F6.1.207 VSLI

Vector Shift Left and Insert takes each element in the operand vector, left shifts them by an immediate value, and inserts the results in the destination vector. Bits shifted out of the left of each element are lost.

The elements must all be the same size, and can be 8-bit, 16-bit, 32-bit, or 64-bit. There is no distinction between data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-2450 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-2537 for the A32 instruction set.

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F2-2396. An A32 VSLI instruction must be unconditional. ARM strongly recommends that a T32 VSLI instruction is unconditional, see *Conditional execution* on page F2-2397.
- <q> See *Standard assembler syntax fields* on page F2-2396.
- <size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

8	when L = 0, imm6<5:3> = 001
16	when L = 0, imm6<5:3> = 01x
32	when L = 0, imm6<5:3> = 1xx
64	when L = 1, imm6<5:3> = xxx
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
- <imm> Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  mask = LSL(Ones(esize), shift_amount);
  for r = 0 to regs-1
    for e = 0 to elements-1
      shifted_op = LSL(Elem[D[m+r],e,esize], shift_amount);
      Elem[D[d+r],e,esize] = (Elem[D[d+r],e,esize] AND NOT(mask)) OR shifted_op;
  
```

F6.1.208 VSQRT

Square Root calculates the square root of the value in a floating-point register and writes the result to another floating-point register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

Single-precision scalar variant

Applies when sz == 0.

VSQRT{<c>}{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when sz == 1.

```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    if dp_operation then
        D[d] = FPSqrt(D[m], FPSCR);
    else
        S[d] = FPSqrt(S[m], FPSCR);
```

F6.1.209 VSRA

Vector Shift Right and Accumulate takes each element in a vector, right shifts them by an immediate value, and accumulates the truncated results into the destination vector. For rounded results, see [VRSRA](#).

The operand and result elements must all be the same type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 then UNPREDICTABLE;
  
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:

8	when size = 00
16	when size = 01
32	when size = 10
- <list> Is a list containing the single 64-bit name of the SIMD&FP register holding the element. The list must be { <Dd>[<index>] }. The register <Dd> is encoded in the "D:Vd" field. The permitted values and encoding of <index> depend on <size>:

<size> == 8	<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
<size> == 16	<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32	<index> is 0 or 1, encoded in the "index_align<3>" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> When <size> == 8, <align> must be omitted, otherwise it is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and the encoding depends on <size>:

<size> == 8	Encoded in the "index_align<0>" field as 0.
<size> == 16	Encoded in the "index_align<1:0>" field as 0b00.
<size> == 32	Encoded in the "index_align<2:0>" field as 0b000.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<size> == 16	<align> is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as 0b01.
<size> == 32	<align> is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as 0b011.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    MemU[address,ebytes] = Elem[D[d],index];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

F6.1.212 VST1 (multiple single elements)

Store multiple single elements from one, two, three, or four registers stores elements to memory from one, two, three, or four registers, without interleaving. Every element of each register is stored. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-2416.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3865.

wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If d+regs > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If d+regs > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD element or structure Load/Store on page F3-2469](#) for the T32 instruction set, or [Advanced SIMD element or structure Load/Store on page F4-2543](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
| 64 | when size = 11 |
- <list> Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:
- { <Dd> }
Encoded in the "type" field as 0b0111.
 - { <Dd>, <Dd+1> }
Encoded in the "type" field as 0b1010.
 - { <Dd>, <Dd+1>, <Dd+2> }
Encoded in the "type" field as 0b0110.
 - { <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
Encoded in the "type" field as 0b0010.
- The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and is encoded in the "align" field as 0b00. Whenever <align> is present, the permitted values are:
- | | |
|-----|---|
| 64 | 64-bit alignment, encoded in the "align" field as 0b01. |
| 128 | 128-bit alignment, encoded in the "align" field as 0b10. Available only if <list> contains two or four registers. |
| 256 | 256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about <Rn>, !, and <Rm>, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            if ebytes != 8 then
                MemU[address,ebytes] = Elem[D[d+r],e];

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- <list> Is a list containing the 64-bit names of the two SIMD&FP registers holding the element. The list must be one of:
- { <Dd>[<index>], <Dd+1>[<index>] }
- Single-spaced registers, encoded as "spacing" = 0.
- { <Dd>[<index>], <Dd+2>[<index>] }
- Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.
- The encoding of "spacing" depends on <size>:
- | | |
|--------------|---|
| <size> == 16 | "spacing" is encoded in the "index_align<1>" field. |
| <size> == 32 | "spacing" is encoded in the "index_align<2>" field. |
- The register <Dd> is encoded in the "D:Vd" field. The permitted values and encoding of <index> depend on <size>:
- | | |
|--------------|--|
| <size> == 8 | <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field. |
| <size> == 16 | <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field. |
| <size> == 32 | <index> is 0 or 1, encoded in the "index_align<3>" field. |
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and the encoding depends on <size>:
- | | |
|--------------|--|
| <size> == 8 | Encoded in the "index_align<0>" field as 0. |
| <size> == 16 | Encoded in the "index_align<0>" field as 0. |
| <size> == 32 | Encoded in the "index_align<1:0>" field as 0b00. |
- Whenever <align> is present, the permitted values and encoding depend on <size>:
- | | |
|--------------|---|
| <size> == 8 | <align> is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1. |
| <size> == 16 | <align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1. |
| <size> == 32 | <align> is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as 0b01. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    MemU[address, ebytes] = Elem[D[d], index];
    MemU[address+ebytes, ebytes] = Elem[D[d2], index];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
```

F6.1.214 VST2 (multiple 2-element structures)

Store multiple 2-element structures from two or four registers stores multiple 2-element structures from two or four registers to memory, with interleaving. For more information, see *Element and structure load/store instructions on page F1-2378*. Every element of each register is saved. For details of the addressing mode see *The Advanced SIMD addressing mode on page F2-2416*.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-3865*.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD element or structure Load/Store on page F3-2469](#) for the T32 instruction set, or [Advanced SIMD element or structure Load/Store on page F4-2543](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:
- { <Dd>, <Dd+1> }
Single-spaced registers, encoded in the "type" field as 0b1000.
 - { <Dd>, <Dd+2> }
Double-spaced registers, encoded in the "type" field as 0b1001.
 - { <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
Single-spaced registers, encoded in the "type" field as 0b0011.
- The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and is encoded in the "align" field as 0b00. Whenever <align> is present, the permitted values are:
- | | |
|-----|--|
| 64 | 64-bit alignment, encoded in the "align" field as 0b01. |
| 128 | 128-bit alignment, encoded in the "align" field as 0b10. |
| 256 | 256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            MemU[address, ebytes] = Elem[D[d+r], e];
            MemU[address+ebytes, ebytes] = Elem[D[d2+r], e];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*regs;
  
```

F6.1.215 VST3 (single 3-element structure from one lane)

Store single 3-element structure from one lane of three registers stores one 3-element structure to memory from corresponding elements of three registers. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-2416.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3865.

A1

Offset variant

Applies when Rm == 1111.

VST3{<c>}{<q>}.<size> <list>, [<Rn>]

Post-indexed variant

Applies when Rm == 1101.

VST3{<c>}{<q>}.<size> <list>, [<Rn>]!

Post-indexed variant

Applies when Rm != 11x1.

VST3{<c>}{<q>}.<size> <list>, [<Rn>], <Rm>

Decode for all variants of this encoding

```

if size == '11' then UNDEFINED;
case size of
  when '00'
    if index_align<0> != '0' then UNDEFINED;
    ebytes = 1; index = UInt(index_align<3:1>); inc = 1;
  when '01'
    if index_align<0> != '0' then UNDEFINED;
    ebytes = 2; index = UInt(index_align<3:2>);
    inc = if index_align<1> == '0' then 1 else 2;
  when '10'
    if index_align<1:0> != '00' then UNDEFINED;
    ebytes = 4; index = UInt(index_align<3>);
    inc = if index_align<2> == '0' then 1 else 2;
d = UInt(D:Vd); d2 = d + inc; d3 = d2 + inc; n = UInt(Rn); m = UInt(Rm);
wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d3 > 31 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If d3 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1

Offset variant

Applies when Rm == 1111.

VST3{<c>}{<q>}.<size> <list>, [<Rn>]

Post-indexed variant

Applies when Rm == 1101.

VST3{<c>}{<q>}.<size> <list>, [<Rn>]!

Post-indexed variant

Applies when Rm != 11x1.

VST3{<c>}{<q>}.<size> <list>, [<Rn>], <Rm>

Decode for all variants of this encoding

```

if size == '11' then UNDEFINED;
case size of
  when '00'
    if index_align<0> != '0' then UNDEFINED;
    ebytes = 1; index = UInt(index_align<3:1>); inc = 1;
  when '01'
    if index_align<0> != '0' then UNDEFINED;
    ebytes = 2; index = UInt(index_align<3:2>);
    inc = if index_align<1> == '0' then 1 else 2;
  when '10'
    if index_align<1:0> != '00' then UNDEFINED;
    ebytes = 4; index = UInt(index_align<3>);
    inc = if index_align<2> == '0' then 1 else 2;
d = UInt(D:Vd); d2 = d + inc; d3 = d2 + inc; n = UInt(Rn); m = UInt(Rm);
wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d3 > 31 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If d3 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- <list> Is a list containing the 64-bit names of the three SIMD&FP registers holding the element. The list must be one of:
- { <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>] }
 Single-spaced registers, encoded as "spacing" = 0.
- { <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>] }
 Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.
- The encoding of "spacing" depends on <size>:
- | | |
|--------------|--|
| <size> == 8 | "spacing" is encoded in the "index_align<0>" field. |
| <size> == 16 | "spacing" is encoded in the "index_align<1>" field, and "index_align<0>" is set to 0. |
| <size> == 32 | "spacing" is encoded in the "index_align<2>" field, and "index_align<1:0>" is set to 0b00. |
- The register <Dd> is encoded in the "D:Vd" field. The permitted values and encoding of <index> depend on <size>:
- | | |
|--------------|--|
| <size> == 8 | <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field. |
| <size> == 16 | <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field. |
| <size> == 32 | <index> is 0 or 1, encoded in the "index_align<3>" field. |
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Alignment

Standard alignment rules apply, see [Alignment support on page B2-75](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n];
    MemU[address,          ebytes] = Elem[D[d], index];
    MemU[address+ebytes,  ebytes] = Elem[D[d2], index];
    MemU[address+2*ebytes, ebytes] = Elem[D[d3], index];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 3*ebytes;
  
```

F6.1.216 VST3 (multiple 3-element structures)

Store multiple 3-element structures from three registers stores multiple 3-element structures to memory from three registers, with interleaving. For more information, see [Element and structure load/store instructions on page F1-2378](#). Every element of each register is saved. For details of the addressing mode see [The Advanced SIMD addressing mode on page F2-2416](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

```

CONSTRAINED UNPREDICTABLE behavior

If d4 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- <list> Is a list containing the 64-bit names of the four SIMD&FP registers holding the element. The list must be one of:
- { <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>], <Dd+3>[<index>] }
Single-spaced registers, encoded as "spacing" = 0.
- { <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>], <Dd+6>[<index>] }
Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.
- The encoding of "spacing" depends on <size>:
- | | |
|--------------|---|
| <size> == 16 | "spacing" is encoded in the "index_align<1>" field. |
| <size> == 32 | "spacing" is encoded in the "index_align<2>" field. |
- The register <Dd> is encoded in the "D:Vd" field. The permitted values and encoding of <index> depend on <size>:
- | | |
|--------------|--|
| <size> == 8 | <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field. |
| <size> == 16 | <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field. |
| <size> == 32 | <index> is 0 or 1, encoded in the "index_align<3>" field. |
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and the encoding depends on <size>:
- | | |
|--------------|--|
| <size> == 8 | Encoded in the "index_align<0>" field as 0. |
| <size> == 16 | Encoded in the "index_align<0>" field as 0. |
| <size> == 32 | Encoded in the "index_align<1:0>" field as 0b00. |
- Whenever <align> is present, the permitted values and encoding depend on <size>:
- | | |
|--------------|--|
| <size> == 8 | <align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1. |
| <size> == 16 | <align> is 64, meaning 64-bit alignment, encoded in the "index_align<0>" field as 1. |
| <size> == 32 | <align> can be 64 or 128. 64-bit alignment is encoded in the "index_align<1:0>" field as 0b01, and 128-bit alignment is encoded in the "index_align<1:0>" field as 0b10. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    MemU[address, ebytes] = Elem[D[d], index];
    MemU[address+ebytes, ebytes] = Elem[D[d2], index];
    MemU[address+2*ebytes, ebytes] = Elem[D[d3], index];
    MemU[address+3*ebytes, ebytes] = Elem[D[d4], index];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 4*ebytes;
```

F6.1.218 VST4 (multiple 4-element structures)

Store multiple 4-element structures from four registers stores multiple 4-element structures to memory from four registers, with interleaving. For more information, see [Element and structure load/store instructions on page F1-2378](#). Every element of each register is saved. For details of the addressing mode see [The Advanced SIMD addressing mode on page F2-2416](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

1	1	1	1	0	1	0	0	0	D	0	0	Rn	Vd	0	0	0	x	size	align	Rm			

type

Offset variant

Applies when Rm == 1111.

VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]

Post-indexed variant

Applies when Rm == 1101.

VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!

Post-indexed variant

Applies when Rm != 11x1.

VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>

Decode for all variants of this encoding

```

if size == '11' then UNDEFINED;
case type of
    when '0000'
        inc = 1;
    when '0001'
        inc = 2;
    otherwise
        SEE "Related encodings";
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size); elements = 8 DIV ebytes;
d = UInt(D:Vd); d2 = d + inc; d3 = d2 + inc; d4 = d3 + inc; n = UInt(Rn); m = UInt(Rm);
wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If d4 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1

Offset variant

VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]

Post-indexed variant

Applies when Rm == 1101.

VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!

Post-indexed variant

Applies when Rm != 11x1.

VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>

Decode for all variants of this encoding

```

if size == '11' then UNDEFINED;
case type of
  when '0000'
    inc = 1;
  when '0001'
    inc = 2;
  otherwise
    SEE "Related encodings";
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size); elements = 8 DIV ebytes;
d = UInt(D:Vd); d2 = d + inc; d3 = d2 + inc; d4 = d3 + inc; n = UInt(Rn); m = UInt(Rm);
wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If d4 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD element or structure Load/Store on page F3-2469](#) for the T32 instruction set, or [Advanced SIMD element or structure Load/Store on page F4-2543](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 10 |
- The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:
- { <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
 Single-spaced registers, encoded in the "type" field as 0b0000.
- { <Dd>, <Dd+2>, <Dd+4>, <Dd+6> }
 Double-spaced registers, encoded in the "type" field as 0b0001.
- The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-2313](#), and is encoded in the "align" field as 0b00. Whenever <align> is present, the permitted values are:
- | | |
|-----|--|
| 64 | 64-bit alignment, encoded in the "align" field as 0b01. |
| 128 | 128-bit alignment, encoded in the "align" field as 0b10. |
| 256 | 256-bit alignment, encoded in the "align" field as 0b11. |
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F2-2416](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F2-2416](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for e = 0 to elements-1
        MemU[address, ebytes] = Elem[D[d], e];
        MemU[address+ebytes, ebytes] = Elem[D[d2], e];
        MemU[address+2*ebytes, ebytes] = Elem[D[d3], e];
        MemU[address+3*ebytes, ebytes] = Elem[D[d4], e];
        address = address + 4*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 32;
  
```

F6.1.219 VSTM, VSTMDB, VSTMIA

Store multiple SIMD&FP registers stores multiple registers from the Advanced SIMD and floating-point register file to consecutive memory locations using an address from a general-purpose register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the alias VPUSH. See [Alias conditions on page F6-3732](#) for details of when each alias is preferred.

A1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

VSTMDB{<c>}{<q>}{.<size>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

VSTM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

VSTMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VSTR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FSTMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as a VSTM with the same addressing mode but stores no registers.

If regs > 16 || (d+regs) > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A2

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

VSTMDB{<c>}{<q>}{.<size>} <Rn>!, <sreglist>

Increment After variant

Applies when P == 0 && U == 1.

VSTM{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>
 VSTMIA{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VSTR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = TRUE; add = (U == '1'); wback = (W == '1'); d = UInt(Vd:D); n = UInt(Rn);
imm32 = ZeroExtend(imm8:'00', 32); regs = UInt(imm8);
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;

```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as a VSTM with the same addressing mode but stores no registers.

If (d+regs) > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

VSTMDB{<c>}{<q>}{.<size>} <Rn>!, <dreglist>

Increment After variant

Applies when $P == 0$ && $U == 1$.

VSTM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>
 VSTMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VSTR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FSTMX".

if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as a VSTM with the same addressing mode but stores no registers.

If `(d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: See [Advanced SIMD and floating-point 64-bit move on page F3-2438](#) for the T32 instruction set, or [Advanced SIMD and floating-point 64-bit move on page F4-2522](#) for the A32 instruction set.

Alias conditions

Alias	is preferred when
VPUSH	<code>P == '1' && U == '0' && W == '1' && Rn == '1101'</code>

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <size> An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.
- <Rn> For encoding A1 and A2: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used. However, ARM deprecates use of the PC.
 For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- ! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
- <reglist> Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.
- <dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
  address = if add then R[n] else R[n]-imm32;
  for r = 0 to regs-1
    if single_regs then
      MemA[address,4] = S[d+r]; address = address+4;
    else
      // Store as two word-aligned words in the correct order for current endianness.
      MemA[address,4] = if BigEndian() then D[d+r]<63:32> else D[d+r]<31:0>;
      MemA[address+4,4] = if BigEndian() then D[d+r]<31:0> else D[d+r]<63:32>;
      address = address+8;
  if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

F6.1.220 VSTR

Store SIMD&FP register stores a single register from the Advanced SIMD and floating-point register file to memory, using an address from a general-purpose register, with an optional offset.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Assembler symbols

<c> For encoding A1 and T1: see [Standard assembler syntax fields on page F2-2396](#). An A32 Advanced SIMD VSUB instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VSUB instruction is unconditional, see [Conditional execution on page F2-2397](#).

For encoding A2: see [Standard assembler syntax fields on page F2-2396](#). An A32 Advanced SIMD VADD instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VADD instruction is unconditional, see [Conditional execution on page F2-2397](#)

For encoding T2: see [Standard assembler syntax fields on page F2-2396](#).

- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.
- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDorVFPEnabled(TRUE, advsimd);
    if advsimd then // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                Elem[D[d+r],e,esize] = FPSub(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize],
StandardFPSCRValue());
    else // VFP instruction
        if dp_operation then
            D[d] = FPSub(D[n], D[m], FPSCR);
        else
            S[d] = FPSub(S[n], S[m], FPSCR);
  
```

F6.1.222 VSUB (integer)

Vector Subtract (integer) subtracts the elements of one vector from the corresponding elements of another vector, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = Elem[D[n+r],e,esize] - Elem[D[m+r],e,esize];
```

F6.1.223 VSUBHN

Vector Subtract and Narrow, returning High Half subtracts the elements of one quadword vector from the corresponding elements of another quadword vector, takes the most significant half of each result, and places the final results in a doubleword vector. The results are truncated. For rounded results, see [VRSUBHN](#).

There is no distinction between signed and unsigned integers.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Applies when Q == 1.

VSWP{<c>}{<q>}{.<dt>} <Qd>, <Qm>

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VSWP instruction must be unconditional. ARM strongly recommends that a T32 VSWP instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for r = 0 to regs-1
    if d == m then
        D[d+r] = bits(64) UNKNOWN;
    else
        D[d+r] = Din[m+r];
        D[m+r] = Din[d+r];
```

F6.1.227 VTBL, VTBX

Vector Table Lookup uses byte indexes in a control vector to look up byte values in a table and generate a new vector. Indexes out of range return 0.

Vector Table Extension works in the same way, except that indexes out of range leave the destination element unchanged.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

VTBL{<c>}{<q>}.8 <Dd>, <list>, <Dm>

VTBX variant

Applies when op == 1.

VTBX{<c>}{<q>}.8 <Dd>, <list>, <Dm>

Decode for all variants of this encoding

```
is_vtbl = (op == '0'); length = UInt(len)+1;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
if n+length > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n + \text{length} > 32$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of instructions, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F2-2396 . An A32 VTBL or VTBX instruction must be unconditional. ARM strongly recommends that a T32 VTBL or VTBX instruction is unconditional, see Conditional execution on page F2-2397 .
<q>	See Standard assembler syntax fields on page F2-2396 .
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<list>	The vectors containing the table. It must be one of: {<Dn>} Encoded as len = 0b00. {<Dn>, <Dn+1>} Encoded as len = 0b01. {<Dn>, <Dn+1>, <Dn+2>} Encoded as len = 0b10. {<Dn>, <Dn+1>, <Dn+2>, <Dn+3>} Encoded as len = 0b11.
<Dm>	Is the 64-bit name of the SIMD&FP source register holding the indices, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();

  // Create 256-bit = 32-byte table variable, with zeros in entries that will not be used.
  table3 = if length == 4 then D[n+3] else Zeros(64);
  table2 = if length >= 3 then D[n+2] else Zeros(64);
  table1 = if length >= 2 then D[n+1] else Zeros(64);
  table = table3 : table2 : table1 : D[n];

  for i = 0 to 7
    index = UInt(Elem[D[m],i,8]);
    if index < 8*length then
```

```
Elem[D[d],i,8] = Elem[table,index,8];  
else  
  if is_vtbl then  
    Elem[D[d],i,8] = Zeros(8);  
  // else Elem[D[d],i,8] unchanged
```

F6.1.228 VTRN

Vector Transpose treats the elements of its operand vectors as elements of 2 x 2 matrices, and transposes the matrices.

The elements of the vectors can be 8-bit, 16-bit, or 32-bit. There is no distinction between data types.

The following figure shows an example of the operation of VTRN doubleword operations.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

This instruction is used by the aliases [VUZP \(alias\)](#) and [VZIP \(alias\)](#). See [Alias conditions on page F6-3753](#) for details of when each alias is preferred.

d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

Alias conditions

Alias	is preferred when
VUZP (alias)	Never
VZIP (alias)	Never

Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2396](#). An A32 VTRN instruction must be unconditional. ARM strongly recommends that a T32 VTRN instruction is unconditional, see [Conditional execution on page F2-2397](#).
- <q> See [Standard assembler syntax fields on page F2-2396](#).
- <dt> Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:
 - 8 when size = 00
 - 16 when size = 01
 - 32 when size = 10
 The encoding size = 11 is reserved.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  h = elements DIV 2;

  for r = 0 to regs-1
    if d == m then
      D[d+r] = bits(64) UNKNOWN;
    else
  
```

```
for e = 0 to h-1  
  Elem[D[d+r],2*e+1,esize] = Elem[Di[m+r],2*e,esize];  
  Elem[D[m+r],2*e,esize] = Elem[Di[d+r],2*e+1,esize];
```

F6.1.229 VTST

Vector Test Bits takes each element in a vector, and bitwise ANDs it with the corresponding element of a second vector. If the result is not zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit fields.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-3865](#).

Part G

The AArch32 System Level Architecture

Chapter G1

The AArch32 System Level Programmers' Model

This chapter gives a system level description of the programmers' model for execution in AArch32 state. It contains the following sections:

- *About the AArch32 System level programmers' model* on page G1-3768.
- *Exception levels* on page G1-3769.
- *Exception terminology* on page G1-3770.
- *Execution state* on page G1-3772.
- *Instruction Set state* on page G1-3774.
- *Security state* on page G1-3775.
- *Virtualization* on page G1-3778.
- *AArch32 PE modes, and general-purpose and Special-purpose registers* on page G1-3780.
- *Process state, PSTATE* on page G1-3789.
- *Instruction set states* on page G1-3794.
- *Handling exceptions that are taken to an Exception level using AArch32* on page G1-3796.
- *Exception return to an Exception level using AArch32* on page G1-3818.
- *Asynchronous exception behavior for exceptions taken from AArch32 state* on page G1-3823.
- *AArch32 state exception descriptions* on page G1-3833.
- *Reset into AArch32 state* on page G1-3852.
- *Mechanisms for entering a low-power state* on page G1-3856.
- *The AArch32 System register interface* on page G1-3861.
- *Advanced SIMD and floating-point support* on page G1-3864.
- *Configurable instruction enables and disables, and trap controls* on page G1-3869.

G1.1 About the AArch32 System level programmers' model

An application programmer has only a restricted view of the system. The System level programmers' model supports this application level view of the system, and includes features that are required for one or both of an operating system (OS) and a hypervisor to provide the programming environment seen by an application. This chapter describes the System level programmers' model when executing at EL1 or higher in an Exception level that is using AArch32.

The system level programmers' model includes all of the system features required to support operating systems and to handle hardware events.

The following sections give a system level introduction to the basic concepts of the ARM architecture AArch32 state, and the terminology that is used for describing the architecture when executing in this state:

- [Exception levels on page G1-3769.](#)
- [Exception terminology on page G1-3770.](#)
- [Execution state on page G1-3772.](#)
- [Instruction Set state on page G1-3774.](#)
- [Security state on page G1-3775.](#)
- [Virtualization on page G1-3778.](#)

The rest of this chapter describes the system level programmers' model when executing in AArch32 state.

The other chapters in this part describe:

- The memory system architecture, as seen when executing in an Exception level that is using AArch32:
 - [Chapter G3 The AArch32 System Level Memory Model](#) describes the general features of the ARMv8 memory model, when executing in AArch32 state, that are not visible at the application level.

Note

[Chapter E2 The AArch32 Application Level Memory Model](#) describes the application level view of the memory model.

 - [Chapter G4 The AArch32 Virtual Memory System Architecture](#) describes the Virtual Memory System Architecture (VMSA) used in AArch32 state.
- The AArch32 System Registers, see [Chapter G6 AArch32 System Register Descriptions](#).

———— **Note** —————

The T32 and A32 instruction sets include instructions that provide system level functionality, such as returning from an exception. See for example, [ERET on page F5-2662](#).

G1.2 Exception levels

The ARMv8-A architecture defines a set of Exception levels, EL0 to EL3, where:

- If EL n is the Exception level, increased values of n indicate increased software execution privilege.
- Execution at EL0 is called *unprivileged execution*.
- EL2 provides support for virtualization of Non-secure operation.
- EL3 provides support for switching between two Security states, Secure state and Non-secure state.

An implementation might not include all of the Exception levels. All implementations must include EL0 and EL1. EL2 and EL3 are optional.

———— Note —————

A PE is not required to implement a contiguous set of Exception levels. For example, it is permissible for an implementation to include only EL0, EL1, and EL3.

The effect of implementation choices on the programmers' model on page D1-1617 provides information on implementations.

When executing in AArch32 state, execution can move between Exception levels only on taking an exception or on returning from an exception:

- On taking an exception, the Exception level can only increase or remain the same.
- On returning from an exception, the Exception level can only decrease or remain the same.

The Exception level that execution changes to or remains in on taking an exception is called the *target Exception level* of the exception.

Each exception type has a target Exception level that is either:

- Implicit in the nature of the exception.
- Defined by configuration bits in the System registers.

An exception cannot target EL0.

Exception levels exist within *Security states*. *The ARMv8-A security model on page G1-3775* describes this. When executing at an Exception level, the PE can access both of the following:

- The resources that are available for the combination of the current Exception level and the current Security state.
- The resources that are available at all lower Exception levels, provided that those resources are available to the current Security state.

This means that if the implementation includes EL3, then because EL3 is only implemented in Secure state, execution at EL3 can access all resources available at all Exception levels, for both Security states.

Each Exception level other than EL0 has its own translation regime and associated control registers. For information on the translation regimes, see *Chapter G4 The AArch32 Virtual Memory System Architecture*.

G1.2.1 Typical Exception level usage model

The architecture does not specify what software uses which Exception level. Such choices are outside the scope of the architecture. However, the following is a common usage model for the Exception levels:

- EL0** Applications.
- EL1** OS kernel and associated functions that are typically described as *privileged*.
- EL2** Hypervisor.
- EL3** Secure monitor.

G1.3 Exception terminology

The following subsections define the terms that are used when describing exceptions:

- [Terminology for taking an exception.](#)
- [Terminology for returning from an exception.](#)
- [Exception levels.](#)
- [Definition of a precise exception.](#)
- [Definitions of synchronous and asynchronous exceptions on page G1-3771.](#)

G1.3.1 Terminology for taking an exception

An exception is *generated* when the PE first responds to an exceptional condition. The PE state at this time is the state that the exception is *taken from*. The PE state immediately after taking the exception is the state that the exception is *taken to*.

G1.3.2 Terminology for returning from an exception

To return from an exception, the PE must execute an exception return instruction. The PE state when an exception return instruction is committed for execution is the state the exception *returns from*. The PE state immediately after the execution of that instruction is the state that the exception *returns to*.

G1.3.3 Exception levels

An Exception level, EL_n , with a larger value of n than another Exception level, is described as being a *higher* Exception level than the other Exception level. For example, EL_3 is a higher Exception level than EL_1 .

An Exception level with a smaller value of n than another Exception level is described as being a *lower* Exception level than the other Exception level. For example, EL_0 is a lower Exception level than EL_1 .

An Exception level is described as:

- *Using AArch64* when execution in that Exception level is in the AArch64 Execution state.
- *Using AArch32* when execution in that Exception level is in the AArch32 Execution state.

G1.3.4 Definition of a precise exception

An exception is described as *precise* when the exception handler receives the PE state and memory system state that is consistent with the PE having executed all of the instructions up to but not including the point in the instruction stream where the exception was taken, and none afterwards.

Other than the *Asynchronous Data Abort*, sometimes referred to as an *external interrupt*, all exceptions that are taken to AArch32 state are required to be precise. For each occurrence of an Asynchronous Data Abort, whether the interrupt is precise or imprecise is IMPLEMENTATION DEFINED.

Where a synchronous exception that is taken to AArch32 state is generated as part of an instruction that performs more than one single-copy atomic memory access, the definition of precise permits that the values in registers or memory affected by those instructions can be UNKNOWN, provided that:

- The accesses affecting those registers or memory locations do not, themselves, generate exceptions.
- The registers are not involved in the calculation of the memory address that is used by the instruction.

In AArch32 state, examples of instructions that perform more than one single-copy atomic memory access are the LDM and STM instructions.

———— **Note** —————

- For the definition of a single-copy atomic access, see [Properties of single-copy atomic accesses on page E2-2319.](#)
- Asynchronous Data Aborts are known as SError interrupts in AArch64 state.
- By definition, all synchronous aborts are precise.

G1.3.5 Definitions of synchronous and asynchronous exceptions

An exception is described as *synchronous* if all of the following apply:

- The exception is generated as a result of direct execution or attempted execution of an instruction.
- The return address presented to the exception handler is guaranteed to indicate the instruction that caused the exception.
- The exception is precise.

An exception is described as *asynchronous* if any of the following apply:

- The exception is not generated as a result of direct execution or attempted execution of the instruction stream.
- The return address presented to the exception handler is not guaranteed to indicate the instruction that caused the exception.
- The exception is imprecise.

For more information about exceptions, see [Handling exceptions that are taken to an Exception level using AArch32 on page G1-3796](#).

G1.4 Execution state

The Execution states are:

AArch64 The 64-bit Execution state.

AArch32 The 32-bit Execution state. Operation in this state is compatible with ARMv7-A operation.

[Execution state on page A1-33](#) gives more information about them.

Exception levels *use* Execution states. For example, EL0, EL1 and EL2 might all be using AArch32, under EL3 using AArch64.

This means that:

- Different software layers, such as an application, an operating system kernel, and a hypervisor, executing at different Exception levels, can execute in different Execution states.
- The PE can change Execution states only either:
 - At reset.
 - On a change of Exception level.

Note

- [Typical Exception level usage model on page G1-3769](#) shows which Exception levels different software layers might typically use.
- [The effect of implementation choices on the programmers' model on page D1-1617](#) gives information on supported configurations of Exception levels and Execution states.

The interaction between the AArch64 and AArch32 Execution states is called *interprocessing*. [Interprocessing on page D1-1605](#) describes this.

G1.4.1 About the AArch32 PE modes

AArch32 state provides a set of *PE modes* that support normal software execution and handle exceptions. The current mode determines the set of registers that are available, as described in [AArch32 general-purpose registers, the PC, and the Special-purpose registers on page G1-3785](#).

The AArch32 modes are:

- Monitor mode. This mode always executes at Secure EL3.
- Hyp mode. This mode always executes at Non-secure EL2.
- System, Supervisor, Abort, Undefined, IRQ and FIQ modes. The Exception level these modes execute at depends on the Security state, as described in [Security state on page G1-3775](#).
- User mode. This mode always executes at EL0.

Note

AArch64 state does not support modes. Modes are a concept that is specific to AArch32 state. Modes that execute at a particular Exception level are only implemented if that Exception level supports using AArch32.

For more information on modes see [AArch32 PE mode descriptions on page G1-3780](#).

The mode in use immediately before an exception is taken is described as the mode the exception is *taken from*. The mode that is used on taking the exception is described as the mode the exception is *taken to*.

All of the following define the mode that an exception is taken to:

- The type of exception.
- The mode the exception is taken from.
- Configuration settings defined at EL2 and EL3.

Monitor mode and Hyp mode can create system traps that cause exceptions to EL3 or EL2 respectively. There is an architected hierarchy where EL2 and EL3 configuration settings affect a common condition, for example interrupt routing. When no traps are enabled for a particular condition, the AArch32 mode an exception is taken to is called the *default mode* for that exception.

In AArch32 state, a number of different modes can exist at the same *Privilege level* (PL). All modes at a particular privilege level have the same access rights for accesses to memory and to System registers. The mapping of PE modes to Exception levels depends on the Security state, as described in [Security state on page G1-3775](#).

[Execution privilege, Exception levels, and AArch32 Privilege levels on page G4-4006](#) gives more information about the PE modes, their associated Privilege levels, and how these map onto the Exception levels.

G1.5 Instruction Set state

In AArch32 state, the *Instruction Set state* determines the instruction set that the PE is executing. In an implementation that follows the ARM recommendations, the available Instruction Set states are:

T32 state The PE is executing T32 instructions.

A32 state The PE is executing A32 instructions.

———— **Note** —————

In previous versions of the ARM architecture:

- The T32 instruction set was called the Thumb instruction set.
- The A32 instruction set was called the ARM instruction set.

—————
For more information, see [Process state, PSTATE](#) on page E1-2286.

G1.6 Security state

The ARMv8-A architecture provides two Security states, each with an associated physical memory address space, as follows:

Secure state	When in this state, the PE can access both the Secure physical address space and the Non-secure physical address space.
Non-secure state	When in this state, the PE: <ul style="list-style-type: none"> • Can access only the Non-secure physical address space. • Cannot access the Secure system control resources.

For information on how virtual addresses translate onto Secure physical and Non-secure addresses, see [About VMSAv8-32 on page G4-4008](#).

G1.6.1 The ARMv8-A security model

The general principles of the ARMv8-A security model are:

- If the implementation includes EL3 then it has two Security states, Secure and Non-secure, and:
 - EL3 exists only in Secure state.
 - A change from Non-secure state to Secure state can only occur on taking an exception to EL3.
 - A change from Secure state to Non-secure state can only occur on an exception return from EL3.
 - If EL2 is implemented, it exists only in Non-secure state.
- If the implementation does not include EL3 it has one Security state, that is:
 - IMPLEMENTATION DEFINED, if the implementation does not include EL2.
 - Non-secure state if the implementation includes EL2.

The AArch32 security model, and execution privilege

The Exception level hierarchy of four Exception levels, EL0, EL1, EL2, and EL3, applies to execution in both Execution states. This section describes the mapping between Exception levels, AArch32 modes, and Privilege levels.

The AArch32 modes Monitor, System, Supervisor, Abort, Undefined, IRQ, and FIQ all have the same privilege. In the AArch32 Privilege model this is PL1.

In Secure state:

- Monitor mode executes only at EL3, and is accessible only when EL3 is using AArch32.
- System mode, Supervisor mode, Abort mode, Undefined mode, IRQ mode, and FIQ mode all:
 - Execute at EL1 when EL3 is using AArch64.
 - Execute at EL3 when EL3 is using AArch32.

This means that there is a difference in the Secure state hierarchy that the PE is using, depending on which Execution state EL3 is using:

- If EL3 is using AArch64:
 - There is no support for Monitor mode.
 - If EL1 is using AArch32, System mode, Supervisor mode, Abort mode, Undefined mode, IRQ mode, and FIQ mode execute at Secure EL1.
- If EL3 is using AArch32:
 - Monitor mode is supported, and executes at Secure EL3
 - System mode, Supervisor mode, Abort mode, Undefined mode, IRQ mode, and FIQ mode execute at Secure EL3.
 - There is no support for a Secure EL1 Exception level.

See [Security behavior in Exception levels using AArch32 when EL3 is using AArch64](#) on page G1-3808 for more information about operation in a Secure EL1 mode when EL3 is using AArch64.

In Non-secure state, the PL1 modes System, Supervisor, Abort, Undefined, IRQ, and FIQ always execute at EL1.

User mode always executes at EL0 and has Privilege level PL0. Hyp mode always executes at EL2 and has Privilege level PL2. See [About the AArch32 PE modes](#) on page G1-3772.

———— **Note** ————

For more information about the Privilege level terminology, see [Execution privilege, Exception levels, and AArch32 Privilege levels](#) on page G4-4006.

Figure G1-1 shows the security model when EL3 is using AArch32, and shows the expected use of the different Exception levels, and which modes execute at which Exception levels.

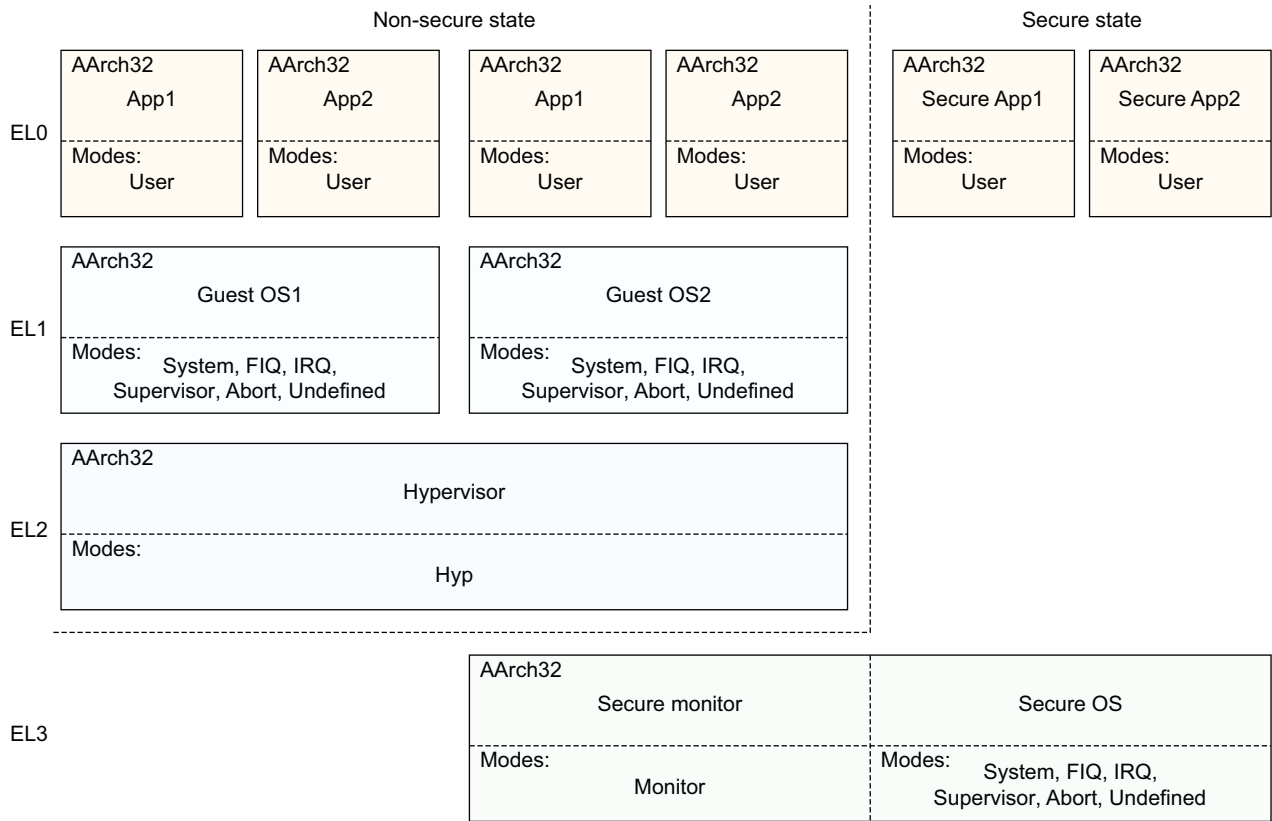

Figure G1-1 ARMv8-A Security model when EL3 is using AArch32

———— **Note** ————

For an overview of the Security models when EL3 is using AArch64:

- See [Figure G1-2 on page G1-3783](#) for the case where EL2, EL1, and EL0 are all using AArch32. This figure shows the implementation of the PE modes.
- See [Figure D1-1 on page D1-1501](#) for an overview of the set of possible implementations.

Figure G1-1 on page G1-3776 shows that when EL3 is using AArch32, the Exception levels and modes available in each Security state are as follows:

Secure state

- EL0** User mode.
- EL3** Any mode that is available in Secure state, other than User mode.

Non-secure state

- EL0** User mode.
- EL1** Any mode that is available in Non-secure state, other than Hyp mode and User mode.
- EL2** Hyp mode.

Execution at EL0 is described as *unprivileged execution*.

A mode associated with a particular Exception level, EL n , is described as an EL n mode.

Note

The Exception level defines the ability to access resources in the current Security state, and does not imply anything about the ability to access resources in the other Security state.

When EL3 is using AArch32, many AArch32 System registers accessible at PL1 are *banked* between the Secure and Non-secure states.

When EL3 is using AArch64 and Secure EL1 is using AArch32, System registers accessible at PL1 are not banked between the Non-secure and Secure states. Software running at EL3 is expected to switch the content of the PL1-accessible System registers between the Secure and Non-secure context, in a similar manner to switching the contents of general purpose registers. For information on the relationship between AArch64 and AArch32 System registers in an interprocessing environment, see [Mapping of the System registers between the Execution states on page D1-1608](#).

For more information on the System registers, see [The AArch32 System register interface on page G1-3861](#).

The *Secure Monitor Call* (SMC) instruction provides software with a system call to EL3. When executing at a privileged Exception level, SMC instructions generates exceptions. For more information, see [Secure Monitor Call \(SMC\) exception on page G1-3838](#) and [SMC on page F5-2970](#).

Note

For more information about the Privilege level terminology, see [Execution privilege, Exception levels, and AArch32 Privilege levels on page G4-4006](#).

Changing from Secure state to Non-secure state

Monitor mode is provided to support switching between Secure and Non-secure states. When executing in an Exception level that is using AArch32, except in Monitor mode and Hyp mode, the Security state is controlled:

- By the **SCR.NS** bit, when EL3 is using AArch32.
- By the **SCR_EL3.NS** bit, when EL3 is using AArch64.

The mapping of AArch32 privileged modes to the exception hierarchy means that it is possible when EL3 is using AArch32 to change from EL3 to Non-secure EL1 without an exception return. This can occur in one of the following ways:

- Using an MSR or CPS instruction to switch from Monitor mode to another privileged mode while **SCR.NS** is 1.
- Using an MCR instruction that writes **SCR.NS** to change from Secure to Non-secure state when in a privileged mode other than Monitor mode.

ARM strongly recommends that software executing at EL3 using AArch32 does not use either of these mechanisms to change from EL3 to Non-secure EL1 without an exception return. The use of both of these mechanisms is deprecated.

G1.7 Virtualization

The support for virtualization described in this section applies only to an implementation that includes EL2. A PE is in *Hyp mode* when it is executing at EL2 in the AArch32 state. An exception return from Hyp mode to software running at EL1 or EL0 is performed using the ERET instruction.

EL2 provides a set of features that support virtualizing the Non-secure state of an ARMv8-A implementation. The basic model of a virtualized system involves:

- A hypervisor, running in EL2, that is responsible for switching between *virtual machines*. A virtual machine is comprised of Non-secure EL1 and Non-secure EL0.
- A number of Guest operating systems, that each run in Non-secure EL1, on a virtual machine.
- For each Guest operating system, applications, that usually run in Non-secure EL0, on a virtual machine.

———— Note ————

In some systems, a Guest OS is unaware that it is running on a virtual machine, and is unaware of any other Guest OS. In other systems, a hypervisor makes the Guest OS aware of these facts. The ARMv8-A architecture supports both of these models.

The hypervisor assigns a *virtual machine identifier* (VMID) to each virtual machine.

EL2 is implemented only in Non-secure state, to support Guest OS management. EL2 provides controls to:

- Provide virtual values for the contents of a small number of identification registers. A read of one of these registers by a Guest OS or the applications for a Guest OS returns the virtual value.
- *Trap* various operations, including memory management operations and accesses to many other registers. A trapped operation generates an exception that is taken to EL2.
- Route interrupts to the appropriate one of:
 - The current Guest OS.
 - A Guest OS that is not currently running.
 - The hypervisor.

In Non-secure state:

- The implementation provides an independent *translation regime* for memory accesses from EL2.
- For the PL1&0 translation regime, address translation occurs in two stages:
 - Stage 1 maps the *virtual address* (VA) to an *intermediate physical address* (IPA). This is managed at EL1, usually by a Guest OS. The Guest OS believes that the IPA is the *physical address* (PA).
 - Stage 2 maps the IPA to the PA. This is managed at EL2. The Guest OS might be completely unaware of this stage.

For more information on the translation regimes, see [Chapter G4 The AArch32 Virtual Memory System Architecture](#).

G1.7.1 The effect of implementing EL2 on the Exception model

An implementation that includes EL2 implements the following exceptions:

- Hypervisor Call (HVC) exception.
- Traps to EL2. [EL2 configurable controls on page G1-3878](#), describes these.
- All of the virtual interrupts:
 - Virtual External interrupt.
 - Virtual IRQ.
 - Virtual FIQ.

HVC exceptions are always taken to EL2. All virtual interrupts are always taken to EL1, and can only be taken from Non-secure EL1 or EL0.

Each of the virtual interrupts can be independently enabled using controls at EL2.

Each of the virtual interrupts has a corresponding physical interrupt. See [Virtual interrupts](#).

When a virtual interrupt is enabled, its corresponding physical exception is taken to EL2, unless EL3 has configured that physical exception to be taken to EL3. For more information, see [Asynchronous exception behavior for exceptions taken from AArch32 state on page G1-3823](#).

An implementation that includes EL2 also:

- Provides controls that can be used to route some synchronous exceptions, taken from Non-secure state, to EL2. For more information see:
 - [Routing exceptions from Non-secure EL0 to EL2 on page G1-3812](#).
 - [Routing debug exceptions to EL2 on page G1-3817](#).
- Provides mechanisms to trap PE operations to EL2. See [EL2 configurable controls on page G1-3878](#).
When an operation is trapped to EL2, the hypervisor typically either:
 - Emulates the required operation. The application running in the Guest OS is unaware of the trap.
 - Returns an error to the Guest OS.

Virtual interrupts

The virtual interrupts have names that correspond to the physical interrupts, as shown in [Table G1-1](#).

Table G1-1 The virtual interrupts

Physical interrupt	Corresponding virtual interrupt
External abort	Virtual External Abort
IRQ	Virtual IRQ
FIQ	Virtual FIQ

Software executing at EL2 can use virtual interrupts to signal physical interrupts to Non-secure EL1 and Non-secure EL0. [Example G1-1](#) shows a usage model for virtual interrupts.

Example G1-1 Virtual interrupt usage model

A usage model is as follows:

1. Software executing at EL2 routes a physical interrupt to EL2.
